The Children's Healthy Living (CHL) Program

The Children's Healthy Living Program for Remote Underserved Minority Populations in the Pacific Region (CHL) is a partnership among the remote Pacific jurisdictions of Alaska; American Samoa; Commonwealth of the Northern Mariana Islands (CNMI); the Freely Associated States of Micronesia (FAS) which includes the Republic of the Marshall Islands (RMI), Republic of Palau, Federated States of Micronesia (FSM); Guam; and Hawaii to study childhood obesity among Pacific children, ages 2 to 8 years. The program is sponsored by the United States Department of Agriculture (USDA), Agriculture and Food Research Initiative.

Figure 1 illustrates CHL's model to influence multiple aspects of the environment to promote healthy food intake and physical activity in young children ages two to eight years old. CHL aims to prevent early childhood obesity in the United States Affiliated Pacific.

CHL Program Objectives

To address the child obesity epidemic in the Pacific, the CHL Program has the following objectives:

- 1) Conduct program/data inventories and situational analysis;
- 2) Train 22 professionals and para-professionals in obesity prevention;
- 3) Develop a Pacific food, nutrition, and physical activity data management and evaluation system, using assessment data, and aggregate, display and communicate available data pertinent to young child obesity;
- 4) Develop and conduct a community-based environmental intervention to prevent, maintain, or reduce young child overweight and obesity;
- 5) Evaluate the environmental intervention; and
- 6) Incur at least one obesity prevention policy change per jurisdiction.

Figure 1. CHL Conceptual Model

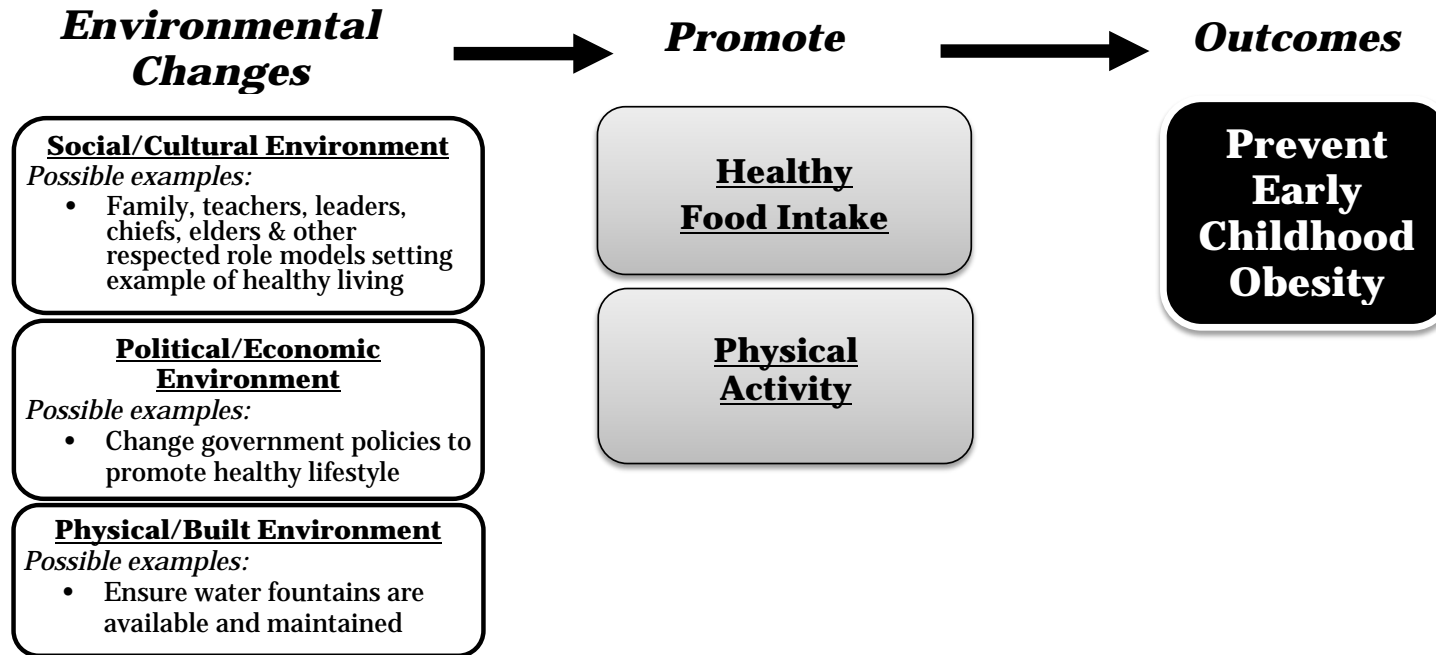

Figure 1. The Children's Healthy Living Program Model to Influence Multiple Aspects of the Environment to Promote Healthy Food Intake and Physical Activity in Young Children (2 -8 years) as a Method to Prevent Early Childhood Obesity in the U.S. Affiliated Pacific

CHL Study Design

The Children's Healthy Living Program Community Randomized Trial was designed to test the intervention by comparing intervention with non-intervention communities on the prevalence of obesity in the U.S.-affiliated Pacific region collected at baseline and follow-up.

Objectives of the CHL Community Randomized Trial and the FAS Prevalence Study

Community Randomized Trial

We are assessing behaviors and anthropometry of children in communities over time as indicators of whether the intervention led to change. Data has been collected at two time points – baseline and post-intervention (about 24 months after baseline measurement) at the end of the CHL community randomized trial.

Objectives for the Community Randomized Trial

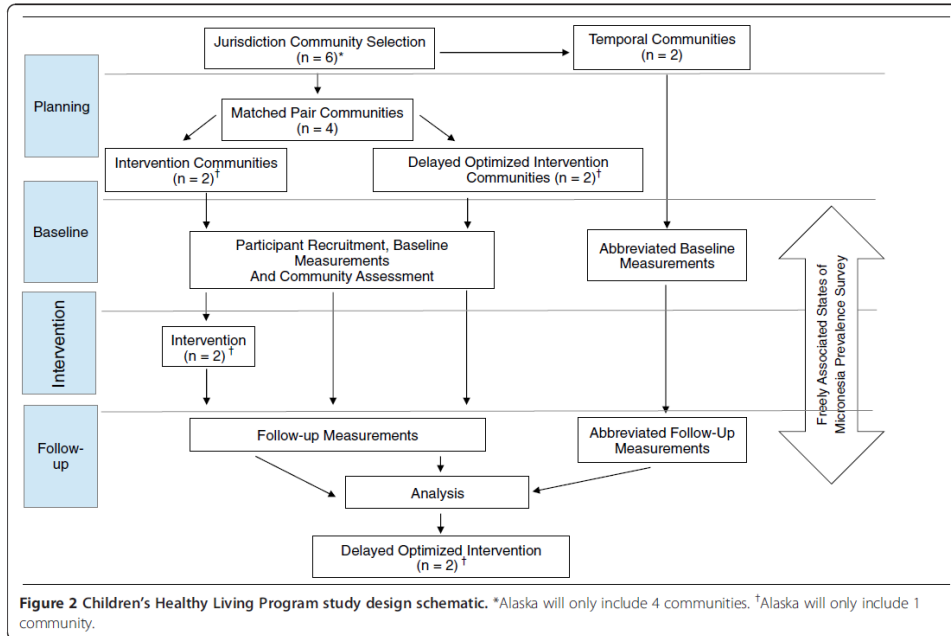

- Measure 2 to 8-year-old children at baseline and post-intervention in selected communities to track behaviors and anthropometry that indicate healthy eating, physical activity, and BMI.
- Decrease the prevalence of young child overweight and obesity by 5%, or a reduction in 0.08 of BMI z-score;
- Decrease the functional outcomes of young child overweight and obesity –
 - decrease acanthosis nigricans by 5%,
 - and increase sleep by 15 min/day;
- increase moderate to vigorous physical activity by 10 min/day
- and decrease sedentary behavior (screen time) by 10 min/day;
- increase healthy eating (fruit and vegetable intake by 1 serving/day),
- increase water intake by ½ cup/day;
- decrease sweetened beverage intake by ½ cup/day,
- Develop a Pacific food, nutrition and physical activity data management and evaluation system

Objectives for the FAS Prevalence Study

- Provide a jurisdiction-specific prevalence of overweight/obesity and related exposures.
- Measure 2 to 8-year-old children at one time point in selected communities to track behaviors and anthropometry that indicate healthy eating, physical activity, and BMI.

CHL Study Design Overview

Figure 2. CHL Study Design Schematic

Community / Site Selection

Communities were identified in Alaska, American Samoa, CNMI, Guam and Hawaii using the 2000 U.S. Census tract data, since 2010 data was not available at the census tract level (U.S. Census Bureau) in 2011 when sites were selected. In the FAS, 2010 country census data were used to inform selection of sites for prevalence survey data collection (Economic Policy, Planning, and Statistics Office of the Republic of the Marshall Islands, 2012; FSM Division of Statistics, 2010; Republic of Palau Office of Planning and Statistics, 2005). The CHL team first selected communities based on initial eligibility criteria and then considered additional selection criteria. Based on the following criteria, communities in each of the jurisdictions were selected to participate in the intervention trial.

Community eligibility criteria:

- population size of >1000,
 - Except for FAS
- >25% of the population of indigenous/native descent
 - Except 15% in **Alaska** due to no census tract with a population of more than 1000 having more than 25% indigenous/native,
- and
- >10% of the population under age 10 years
 - (based on combining census tract data groups of < 5 years of age and 5 – 9 years of age)
 - to have sufficient population size for CHL target of 2 to 8 year olds.

Additional selection criteria:

- adequate settings for sampling and measuring children (e.g., schools);
- reasonable accessibility for the CHL team
 - (e.g., isolated communities that would require substantial travel logistics were excluded);
- community cohesiveness (Swinburn et al., 2007)

Additional selection criteria for intervention and delayed optimized (comparison) communities:

- evidence that children live and go to school in the same community
 - (i.e., not a commuter community),
- ensuring that the measured children have an opportunity to be exposed to the intervention;
- a minimal risk of contamination between matched-pair communities;
- sufficient settings for intervention (e.g., community centers, parks, churches, and stores)

Additional selection criteria for FAS:

- scheduled air or boat service, and geographical representation.

A list of all eligible communities was created for each of the jurisdictions based on the above criteria. The communities were matched to form pairs based on the following factors:

- percentage in poverty and population density (both from the U.S. census),
- distance from urban centers,
- and percentage overweight/obesity, when available.

In American Samoa, CNMI, Guam and Hawaii, four communities were selected (two matched-pairs), while two communities were selected (1 matched-pair) in Alaska due to large distances between sites (see Figure 2).

In each pair, one community was randomly assigned to intervention and the other to a delayed optimized intervention (community will receive intervention at the end of the main trial). Randomization to intervention, in general, produces study groups that are comparable with

respect to confounding variables (Friedman, Furberg, & DeMets, 1998). A statistician who was not part of the CHL team performed the randomization. The **delayed optimized intervention communities** will be called **comparison communities** in this CHL Data Dictionary.

Two additional non-matched communities (third and fourth for Alaska and fifth and sixth for other jurisdictions) were selected from the eligible list of communities to serve as temporal indicators of anthropometry status (see Figure 2). Generally, the communities selected for temporal assessment had been considered to participate as a matched pair; however, they often did not match another eligible community well or they had less community cohesiveness, which was not as important for a community providing prevalence information only. The temporal communities will not receive the intervention program as part of the CHL trial and early dissemination phase.

In the FAS region, three to five communities were selected for collection of baseline (prevalence) survey data in each of Chuuk, Kosrae, Pohnpei, Yap, Palau and the RMI (n=200 children per location), according to the same criteria, plus a criteria of geographic representation. A total of 27 communities will provide baseline (prevalence) survey data from the FAS.

Thus, in total, four communities in Alaska and six communities in each of the remaining four CHL intervention jurisdictions were selected for a total of twenty-eight communities across the CHL region for participation in the CHL community intervention trial: 9 matched pairs (18 sites total) and 10 temporal sites.

A cross-sectional sample of children in each of the CHL intervention communities is being assessed for outcomes at baseline and post-intervention around 24 months from baseline. Additionally, the outcomes are being assessed once in the FAS region to provide prevalence information.

The intervention does not explicitly target the assessed children; they serve as representatives of their communities. Children who participate at both time points provide repeated measures and serve as an embedded longitudinal sample.

Power and sample size calculations

The process for sample size and power estimation was described in Wilken [sic] et al., 2013). Sample size estimates were based on the need for a sufficient number of communities and children in each of the five jurisdictions to ensure adequate statistical power to detect meaningful differences between intervention arms in overweight and related outcomes (listed previously) overall and for select outcomes within jurisdictions. The effect size, Cohen's d , (Cohen, 1988) was calculated based on an analysis of 2,000 simulated data sets with children clustered within community clustered within jurisdiction. The intervention effect was tested based on an F test of the interaction term of intervention group and time from a mixed model

of the outcomes, accounting for the clustering in a group-randomized trial (GRT) by adjusting the test degrees of freedom to the number of communities (Hsieh, 1988). The calculations assume a minimum n or sample size of 150 children with anthropometry and a minimum n of 100 children with accelerometry and food and activity logs in six communities in four jurisdictions and in two communities in Alaska; this assumption is conservative as the goal is a sample size of 180 children per community.

An expected correlation for communities within jurisdictions was low with an estimate of the interclass correlation coefficient (ICC) that varied between 0.02 to 0.04. We assumed a critical level of 0.05 (two-sided), a power of 80%, and a constant sample size at baseline and post-intervention (around 24 months). The respective effect sizes for an ICC of 0.02 and 0.04 are modest at 0.26 and 0.35 for outcomes with $n=150$. Using means and variances for the outcomes from previous research (de Silva-Sanigorski, 2010; Murray et al., 2004; Westerlund, Ray, & Roos, 2009), the minimum detectable differences for the two ICC values were 0.09 and 0.12 for BMI z-score, 21 and 28 minutes of television viewing, and 11 and 15 minutes of sleep. The respective effect sizes for an ICC of 0.02 and 0.04 are also modest at 0.31 and 0.42 for outcomes with $n=100$. Using means and variances for the outcomes from previous research (de Silva-Sanigorski, 2010; Murray et al., 2004; Ludwig, Peterson, & Gortmaker, 2001; Vorwerk, Petroff, Kiess, Bluher, 2013), the minimum detectable differences for the two ICC values were 0.50 and 0.67 servings of vegetables, 0.45 and 0.61 servings of fruits, 0.45 and 0.60 servings of water, 0.34 and 0.46 servings of SSB, and 33 and 45 minutes of PA with metabolic equivalent values (METs) > 3 , based on accelerometry.

Measures Overview

The CHL study design was to collect data on body size, functional outcomes of obesity, food intake, physical activity, lifestyle behavior which includes screen time, and demographics. These are measured through anthropometry, food and activity logs, questionnaires, and visual inspection (of the neck).

The following study outcomes were measured for children across jurisdictions using a common methodology:

Body size:

Body size measures included weight, height and waist circumference and the resultant calculations of BMI, percent overweight and obese. Trained staff in all jurisdictions used standardized instruments, such as common scales for weight, stadiometers for height, and tape measures for waist circumference. Body size outcomes include overweight, defined as the 85th - 94th percentile for BMI (weight, kg/height, m²) and obesity, defined as greater than or equal to the 95th percentile for BMI (Centers for Disease Control and Prevention, 2009), BMI Z-score and waist circumference. . During training sessions on anthropometry, inter- and intra-person reliability of each measurement, as well as agreement to an expert measurer, were determined. We followed guidelines by Zerfas to assess agreement (1986).

Functional outcomes of obesity

Functional outcomes of obesity (Ropka, 2002) included sleep quality and duration, both as minutes per night from the accelerometer and self-reported average duration, and presence of Acanthosis nigricans as an indicator of insulin resistance/pre-diabetes.

Food intake:

We calculated nutrients and food groups of the children's diet from two days of food logs, which were completed by the parent/ caregiver, with assistance from other child caregivers. We are using these data to estimate prevalence of dietary patterns in the region. These data have been entered into PacTrac3. We used the food composition database which was developed and is maintained by the Nutrition Support Shared Resource at the UH Cancer Center. This database includes information on local foods in the Pacific region.

Physical activity:

We measured physical activity with several strategies with which we have experience – accelerometers and physical activity logs.

We developed 24-hour activity logs to measure physical activity of children in the PacDASH study, which were successfully pilot-tested for children aged 3-5 years. Parents were asked to record all activities for the child for the two days when food intake was recorded. These activity logs provided us with the type and duration of each activity of their child. Trained CHL staff assigned a metabolic equivalent (MET) that reflected the energy expenditure for the child's activity (Ridley, Ainsworth, & Olds, 2008), and a 24-hour METs could be computed.

Children were asked to wear accelerometers for six days in this study. In Year 1 of CHL, we pilot tested Actical accelerometers as a method to measure physical activity in young children to be used in the full study. Based on our successful CHL Physical Activity Pilot results, we used accelerometry at all sites (Nigg et al., 2012; Ettienne-Gittens et al., 2012, submitted). The CHL Coordinating Center (CCC) trained staff at each jurisdiction on use of the accelerometers before measurement began.

Other questionnaires:

Parents / caregiver respondents for the children completed questionnaires about demographics, lifestyle measures and culture. Lifestyle measures included food security and food expenditures (USDA, 2008). In addition, parents/caregivers completed standardized questions about screen time, regarded as sedentary behavior and a lifestyle measure (Haas & Nigg, 2009).

Table 1 displays an overview of all the measures used for CHL, and the frequency of their use. The community level measures are described in Volume 2 of the CHL Data Dictionary.

Table 1: The Children’s Healthy Living (CHL) Program Individual-level Measures

Individual level measures				Assessed in matched-pair communities		Assessed in temporal communities		Assessed in FAS [†]

†FAS = Freely Associates States of Micronesia.

X = indicates measurement completed.

*Surrogate reporter = parent/caregiver.

**A minimum of 100 children in each matched-pair community and FAS jurisdiction will wear an accelerometer.

#Randomly assigned non-consecutive days.

Frequency of measurements

The initial baseline measurement period for **individual** measures was between October 2012 through February 2014 to complete measurement in all five jurisdictions. The post-intervention measurement period will be between January 2015 – December 2015.

In FAS for the prevalence study, measurement began in October 2013 and may continue through early 2015.

Note in the temporal communities we had an abbreviated set of individual level measures, including height, weight, waist circumference and demographics.

Data Collection Visit Protocol

Measurements were taken in either a school or preschool setting (e.g., Head Start), or in a community-based setting (e.g., community recreation center or a community event) at baseline and at post-intervention (about 24 months).

Intervention and Comparison Communities

Parents of two to eight-year-old children were approached to learn about the study, to participate in an informed consent process and sign a consent form, to answer screening questions, and to receive instructions about completing the forms. Staff reviewed the forms for completeness as they were turned in and asked the parent to complete unanswered questions, if they were willing. All of the aforementioned may have happened at one time or over two occasions. Staff also provided training on how to complete a Food and Activity Log, using food models, etc. to demonstrate. Also, parents learned how to re-apply a wrist band and accelerometer, in the event it came off during the 6-day wearing period for the child. Parents were asked to notice if their child was still wearing the accelerometer at home and to put it back on, if the child was willing. Parents also kept a food log on their child for two days as well as an activity log for the same two days. One week after the child began to wear the accelerometer, parents sat with CHL staff to review their child's food and activity logs, and document receipt of the record.

After receiving the child's assent, the anthropometry measures and the screening for acanthosis nigricans took place. Children in the intervention and comparison communities were asked to wear an accelerometer for 6 days. CHL staff asked for the child's assent and choice of wrist band before placing the accelerometer.

The protocol called for two visits by participants in intervention and comparison communities. However, for some circumstances, participants only had to attend one visit.

The circumstances for one visit were when accelerometers were not used. After a certain number of participants wore accelerometers, they were not used in every measurement event. Also, in community events without an organization group leader who could help with follow up of retrieving accelerometers, measurement events could be held without using accelerometers.

When Food and Activity Logs (FAL) were used, but no accelerometer, sometimes participants returned their FAL by mail or to another collection site. Participants asked to return items by mail were given stamped addressed large envelopes to send their FALs back. Phone follow-up occurred as needed. In some circumstances after a certain number of participants had already completed Food and Activity Logs, the measurement package in intervention and comparison communities did not collect FAL data from participants.

Temporal Communities

Parents of 2 to 8-year-old children were approached to learn about the study, to participate in an informed consent process and sign a consent, and to receive instructions for the demographics form. Staff reviewed the form as it was turned in and asked parents about any incomplete sections. The aforementioned happened at one time or over two occasions.

Their child may have been measured with the parents present or at a different time in their classroom.

Study Sample

Table 2 shows the sample size goals for each intervention, comparison, and temporal community in the jurisdictions. The projected sample size for the individual level measurements will be the same at baseline and post-intervention.

Table 2: Frequency and Sample Size Goals for CHL Measurement

Frequency and Sample Size Goals for CHL Measurement				
			Individual Measures	
		n size for each community	Baseline	Post-intervention
American Samoa, CNMI, Guam, and Hawaii				
Intervention community 1	Matched pair 1	150	✓	✓
Comparison 1		150	✓	✓
Intervention community 2	Matched pair 2	150	✓	✓
Comparison 2		150	✓	✓
Temporal	2 communities	150	✓ Abbreviated	✓ Abbreviated
Alaska				
Intervention community 1	Matched pair 1	200	✓	✓
Comparison 1		200	✓	✓
Temporal	2 communities	200	✓ Abbreviated	✓ Abbreviated
FAS: Pohnpei, RMI, Palau, Yap, Chuuk, Kosrae				
All FAS Communities		200	✓	

As of May 9, 2014 the actual sample size for the baseline measurement in all CHL jurisdictions is 5,132, which is the number of participants whose parents/caregivers consented.

The total proposed sample size for anthropometry measures for CHL is 4100 children for the cross-sectional samples at baseline and at 24 months. For the embedded longitudinal (individual) design, the intent is to collect repeated measurements from 40-50% of children with baseline measurements.

Table 3: Number of participants consented at baseline for CHL Community Randomized Trial and FAS Prevalence Study

Number of Participants Consented at Baseline for CHL Community Randomized Trial and FAS Prevalence Study		
	Baseline	Post-Intervention
	# Consented	# Consented

RMI	218	-
Palau	214	-
Chuuk	232	-
Yap	205	-
Kosrae	207	-
FAS Prevalence Data (total)	1,287	-
CHL Total	5,775	4,685

Recruitment

Participant recruitment goals

In order to meet sampling goals for children between the ages of 2 – 8 years, recruitment activities involve schools and other community venues and activities. Recruitment sites consisted of Head Starts, pre-schools/day cares, kindergartens, WIC sites, community health centers and other appropriate venues (e.g., parks and community recreation centers). Recruitment efforts, led by CHL staff in each jurisdiction, involve close collaboration with community liaisons (e.g., teachers, school staff, program directors, matai, mayors) to enhance participation and retention throughout the measurement protocol. The teams in all jurisdictions tailored the recruitment strategies to work effectively with the stakeholder organizations while meeting recruitment goals of CHL.

Screening and Eligibility Criteria

Those who attended a measurement event and agreed to informed consent were asked a series of screening questions to confirm their child's eligibility. Eligibility criteria were selected for the purpose of an obesity prevention and management intervention trial. Parents of potential participants were asked to complete a screening with study staff to confirm the health status of the child. The screening questions for study inclusion are in the appendix.

Eligibility Criteria: The participating children will be 2-8 years old, healthy with no known cardiovascular disease, pulmonary or metabolic disease signs and/or symptoms; no known disease or joint problems or injuries that would be exacerbated by physical activity. The child will be stable in the use of any prescribed medications. The child will live in the selected community.

Exclusion Criteria:

1. Children outside the age group (under two or over eight years)
2. Known orthopedic, psychological or neurologic impairments that prevent physical activity
3. Presence or history of any metabolic or chronic health problems known to affect intermediary metabolism (e.g. untreated thyroid disease, cancer, hepatic disease, renal disease, diabetes, cardiovascular disease, hypertension)
4. Irregular use of prescription or over-the-counter medications known to affect appetite, food intake or intermediary metabolism (e.g. appetite suppressants, lithium, antidepressants, etc.)

Data Cleaning and Validation

Data were collected at the five jurisdictions for the community randomized trial and six jurisdictions (four states of FSM, RMI, and Palau) for the FAS prevalence study. In most cases, these jurisdictions entered the data into CHL Data Entry System and into PacTrac3. Data are stored on a password-protected secure server and on secure computers. Ultimately, the jurisdictions sent the data to the CHL Coordinating Center in Hawaii through secure transfer methods.

In Hawaii, the second data entry occurred, which involves *In process, more later* **
The CHL Data Manager was responsible for preliminary data validation cleaning and analysis for the CHL Measurement study.

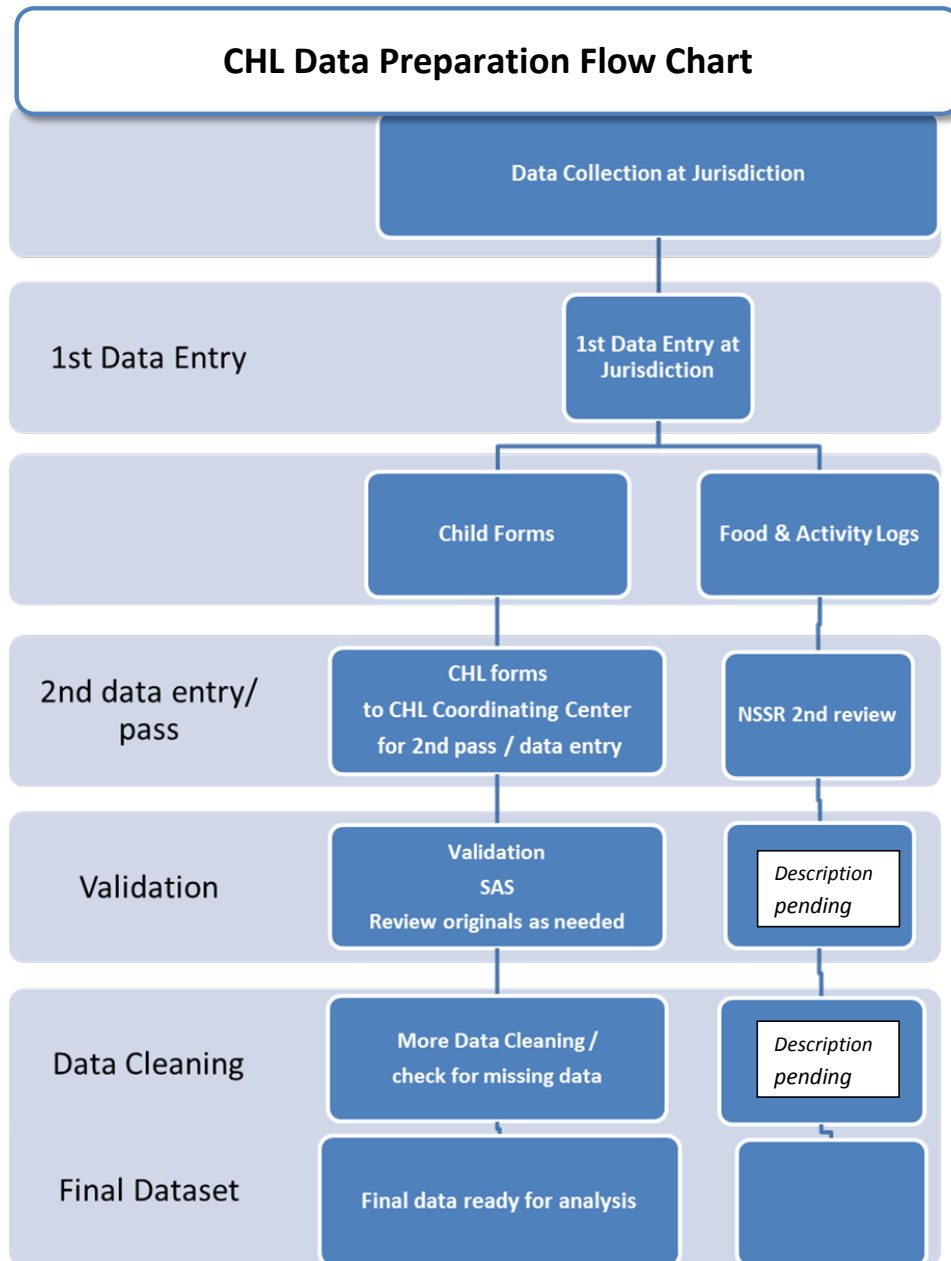

At the validation stage, any discrepancies found between the first data entry and second data entry datasets were corrected at the data set of the second data entry. Scanned images of individual forms are examined to validate the corrections.

Additional data cleaning is conducted on the validated data set when new variables are calculated or a variable is particularly examined, e.g., in the calculation of bmi, bmiz, bmpi and other related variables. Variables which need particular attentions include the following new variables:

1. dob_new (newly created date of birth). Any corrections in child's date of birth was done on this newly created variable. The original variable, dob, is not changed and should not be used;
2. date_anthr_new (newly created date of anthropometry measurement). Any corrections in child's date of anthropometry measurement was also done upon this newly created variables. The original variable, date_anthr, remained unchanged and should not be used;
3. Child's measuers on ht (ht1, ht2, ht3, etc), or wt (wt1, wt2, wt3, etc.) or waist (waist1, waist2, waist3, etc.): if obvious errors were found on those measures, the errors are therefore corrected before the calculation of bmi and related variables.

Figure 3 displays the process of data preparation prior to analysis -- the CHL data preparation flow chart. NSSR is the Nutrition Support Shared Resource.

Figure 3. CHL Data Preparation Flow Chart

Measures: Description and Variables

Child and Household Demographics (Form 23-02)

The child and household demographics questionnaire, answered by the parent / caregiver, contained questions about the child, the caregiver, and the household. This demographic questionnaire, Form 23-02, --*“Information about your child and household”* was used at all CHL measurement sessions in all communities – intervention, comparison (delayed optimized), and temporal. These questions measured the dimensions and dynamics of our population and allow us to compare the variation amongst jurisdictions.

Two versions exist of Form 23-02 – one is used throughout all of CHL except for FAS. This descriptive section and the following variable tables correspond to Form 23-02.

At the end of this section is a section specifically for FAS. It includes all the Form 23-02 variables used in FAS, which also covers the changes made to adapt the form for FAS. The actual variables and their associated response codes are included.

Many of these questions were adapted from The Center for Alaska Native Health Research Demographic and Medical Screening Questionnaire. *

Information collected included **household** composition and each member’s relationship to the child as well as household income.

Questions about the **caregiver** included their relationship to the child, their marital status, educational attainment, employment status, food assistance, and religion. Addressing food security and availability was also included in the demographic questionnaire, to help understand the support services used by participants in our geographically varied jurisdictions. The food security questions were adapted from NHANES (cdc.gov/nchs/data/nhanes/nhanes_11_12/fsq_family.pdf). In some of the CHL community meetings, religion was identified as an important factor for group gatherings and decision making in the community. Therefore, we included inquiries about religion.

Questions about the **child** included his or her birthdate, sex, racial and ethnic background, languages spoken, place of birth, early child life information -- their birth weight and early feeding, and medical conditions. The demographic form is also used to collect numbers of hours of sleep / day and medical information. Sources include the Behavioral Risk Factor Surveillance System 2011 survey questions and the 2011 Middle School Youth Risk Behavior Survey.

The Child Information section uses validated questions for race/ethnicity. In developing

the ethnicity questions, we were informed by multiple sources including the CDC Race and Ethnicity code set version 1.0 (Centers for Disease Control and Prevention, 2000), the Demographic Information form from the 2010 Census Questionnaire (U.S. Census Bureau, 2009), and Dr. Novotny's previous study, the Healthy Living in the Pacific Islands (2001-9) questionnaire. Sources used in this section include the 2010 Census Questionnaire (U.S. Census Bureau, 2009), the Demographic Information form from the Federal Trade Commission (2012), and The National Health Plan Collaborative Toolkit (2008). The race questions will allow proper reporting to the USDA, based on OMB requirements (http://www.whitehouse.gov/omb/fedreg_race-ethnicity).

Table 4: Demographic and Other Variables, Form 23-02

Demographic and Other Variables from Information About Your Child And Household: Form 23-02					
Variable Name	Variable Description	Data Type	Length	Response Options / Codes	Notes
ID	CHL subject ID	Character	7	The first two numbers must be from 01 to 11, the third number must be one from 1 to 6, the fourth number must be one from 1, 2, or 3 and the last 3 numbers are from 1 to 200.	Set as a primary key. Format is in the form of JJCYY### where JJ is a number for jurisdiction, C is the number for each community in a jurisdiction, Y is the year of measurement, and ### is a number from 1 to the number of enrollees per community.
DATE_DEMO	Date of Interview	Date	10	Range = (October, 2012 to February, 2013)	Format should be MMDDYY10.
COLLECT_NO	Time (year) when the measurement is taken	Character	1	1=Baseline 2=24 months into intervention or post-intervention	
CHECKER_DEMO1	Initials of person who checked the form's first page.	Character	3		
CHECKER_DEMO2	Initials of person who checked the form's page 2.	Character	3		
CHECKER_DEMO	Initials of person who	Character	3		

**Demographic and Other Variables from
Information About Your Child And Household: Form 23-02**

Variable Name	Variable Description	Data Type	Length	Response Options / Codes	Notes
O3	checked the form's page 3.				
CHECKER_DEM O4	Initials of person who checked the form's page 4.	Character	3		
CHECKER_DEM O5	Initials of person who checked the form's page 5.	Character	3		
CHECKER_DEM O6	Initials of person who checked the form's page 6.	Character	3		
CHECKER_DEM O7	Initials of person who checked the form's page 7.	Character	3		
SEX	Sex of the CHL subject	Character	1	1=Boy 2=Girl	
DOB	CHL subject date of birth	Date	10		Format should be MMDDYY10.
AGE_ BASELINE	Age of child at baseline interview	Character	1	Range=2-8	In 24 month data set, this variable is still named "age_baseline", although it actually refers to the child's age at the time point of data collection of demo forms for 24 month data collection.
GRADE	CHL subject grade in school in Fall 2012	Character	1	1=Head Start 2=Day Care 3=Preschool	

**Demographic and Other Variables from
Information About Your Child And Household: Form 23-02**

Variable Name	Variable Description	Data Type	Length	Response Options / Codes	Notes
				4=Kindergarten 5=Elementary 6=None 9=missing	
RELATION_ DEMO	Respondent relationship to the child	Character	2	01=Biological mom 02=Step mom 03=Adoptive mom 23=Step mom and Adoptive mom 04=Birth dad 05=Step dad 06=Adoptive dad 56=Step dad and Adoptive dad 07=Legal Guardian, Caregiver, Other 09 =missing	Only one choice can be selected
REL_OTHER	Other type of respondent relationship to the child	Character	25		Only those choose 07 for variable <i>RELATION</i>
MARITAL	Respondent current marital status	Character	1	1=Married 2=Divorced 3=Separated 4=Widowed 5=Single and not living with boyfriend, girlfriend, or partner	Only one choice can be selected

**Demographic and Other Variables from
Information About Your Child And Household: Form 23-02**

Variable Name	Variable Description	Data Type	Length	Response Options / Codes	Notes
				6=Single and living with boyfriend, girlfriend, partner 7 =Other 9=Missing	
MARI_OTHER	Respondent current marital status-Other	Character	15		Only for those who choose 7=other for variable <i>MARI</i>
COUNT_MOTHER	Number of person who currently lives in the child's household -Mother	Character	2		
COUNT_FATHER	Number of person who currently lives in the child's household -Father	Character	2		
COUNT_BROTHER	Number of person who currently lives in the child's household -Brother	Character	2		
COUNT_SISTER	Number of person who currently lives in the child's household- Sister	Character	2		
COUNT_GRANDMA	Number of person who currently lives in the child's household -Grandmother	Character	2		
COUNT_GRANDPA	Number of person who currently lives in the child's	Character	2		

**Demographic and Other Variables from
Information About Your Child And Household: Form 23-02**

Variable Name	Variable Description	Data Type	Length	Response Options / Codes	Notes
	household -Grandfather				
COUNT_AUNT	Number of person who currently lives in the child's household -Aunt	Character	2		
COUNT_UNCLE	Number of person who currently lives in the child's household -Uncle	Character	2		
COUNT_COUSIN	Number of person who currently lives in the child's household -Cousin	Character	2		
COUNT_FRIEND	Number of person who currently lives in the child's household -Friend	Character	2		
COUNT_OTHEREL	Number of other persons who currently lives in the child's household	Character	2		
OTHEREL	People who currently lives in the child's household_Other relationship	Character	20		If not specified, put "unknown" in this field.
CHILD1_SEX	Sex of other children (for example: siblings, cousins, friends) who live with your child on a regular basis – Child 1	Character	1	1=Boy 2=Girl	

**Demographic and Other Variables from
Information About Your Child And Household: Form 23-02**

Variable Name	Variable Description	Data Type	Length	Response Options / Codes	Notes
CHILD1_YRS	Age (years) of other children (for example: siblings, cousins, friends) who live with your child on a regular basis – Child 1	Character	2		
CHILD1_MTS	Age (months) of other children (for example: siblings, cousins, friends) who live with your child on a regular basis – Child 1	Character	2		
CHILD2_SEX	Sex of other children (for example: siblings, cousins, friends) who live with your child on a regular basis – Child 2	Character	1	1=Boy 2=Girl	
CHILD2_YRS	Age (years) of other children (for example: siblings, cousins, friends) who live with your child on a regular basis – Child 2	Character	2		
CHILD2_MTS	Age (months) of other children (for example: siblings, cousins, friends) who live with your child on a regular basis – Child 2	Character	2

FAS Version -- Child and Household Demographics (Form 23-02)

We adapted for FAS Form 23-02 Information about your child and household, which includes the demographics questions. We changed, added, or dropped some items to tailor Form 23-02 for FAS. For example, the lower income response category was changed from under \$10,000 to three categories: under \$2500, from \$2500 to less than \$5000, and from \$5000 to less than \$10000. We dropped questions about SNAP (food stamps) and WIC, since they are not available in the FAS region. We added questions about resource availability and the source of water in the home as well as the main type of fuel their household uses for cooking. Questions about the parent/caregiver's and the household's betel nut, tobacco and alcohol use are part of the new questions. We added questions about the participating child's frequency of tooth brushing and preventative dental care, as these items are of particular interest to this region. Table 5 displays the variables that were changed or added for FAS or that offered different coding for responses.

Table 5: Demographic and Other Variables, Form 23-02 -- FAS version – Additional or modified variables only

CHL24 Month Version -- Child and Household Demographics (Form 23-02)

We adapted Form 23-02 Information about your child and household which includes the demographics questions for CHL 24month data collection. We changed, added, or dropped some items to tailor Form 23-02 for CHL 24month. For example, we added questions about resource availability and the source of water in the home as well as the main type of fuel their household uses for cooking. We also added questions about child's specific health conditions and questions about the participating child's frequency of tooth brushing and preventative dental care. Table 6 displays the variables that were changed or added for CHL 24month or that offered different coding for responses.

Created New Variables from Form 23-02

During the data cleaning process, many new variables were created under various reasons. Whenever a correction was made to an original variable, then a new variable is created in order to differentiate it from the original variable. Some new variables were created to address the needs of various research questions. **Those new variables should always be used in place of the original variables.** If the methods or protocols used in creating those new variables are simple enough, they are then described in the following table (Table 5) under the column “Notes”. For some variables, e.g., new race or ethnicity variable, the methods/protocols used are complicated. Therefore, the following section in particular, describes the protocols used in create the new race or ethnicity variables.

Proposed methods for creating a new race_ethnicity variable

From the original data collection form, we get a total of 45 variables related to race and ethnicity. From those 45 variables, we have created a new variable (*race_new_omb*), which is based on US Office of Management and Budget (OMB)

Definition and has 6 categories: White, Black, AIAN, Asian, NHPI, and More than one race. Whether a child is of Hispanic origin or not is not considered when creating this variable.

Another new variable, "*ethnicity_new*" is created in order to capture or reflect a study participant's race/ethnic composition. This variable is currently in the format of "RACE1-SUBCATEGORIES_RACE2-SUBCATEGORIES..." in alphabetic order, e.g.,

"ASIAN-CHINESE_ASIAN-FILIPINO_ASIAN-INDIAN_ASIAN-JAPANESE_ASIAN-THAI_NHPI-CHAMORRO". The reason to show the larger race category before the smaller ethnic group is to meet the needs of further researchers who may not be familiar with the populations in the Pacific. The variable "*ethnicity_new*" currently describes all available ethnicity/race group a participating child has chosen. To create this variable, one of the first steps is to check each of the open space variables and make corrections as needed. For example, for one of the study subject, AIAN is selected; however under *aian_descr*, it is written "BGD, Bangla". There are no other race or ethnic categories selected for this subject. Therefore, we are assuming that this child actually is of Asian, instead of AIAN and the following correction was then made:

```
(a). IF aian_descr= 'BGD, Bangla' THEN DO;  
    AIAN='0'; AIAN_OTHER='0'; AIAN_DESCR=""; ASIAN_other='1';ASIAN_DESCR='BANGLADESHI';  
END;
```

As a result, a total of 45 new variables were created to differentiate them from the original 45 race/ethnicity related variables (see Table 5).

The variable "*ethnicity_new*" currently has 457 categories. To further reduce the categories, we are proposing to create another new race/ethnic variable. The variable is named "*race_new_pacific*" and is created using the following protocols:

- I. **Single race group: some of the subgroups are combined. This includes the following single race groups:**
 - a. Among Asian only (3 groups: Filipino, Asian-East and Asian-other):
 - i. FILIPINO: This category will include Filipino only ethnic group.
 - ii. EAST-ASIAN: including Chinese, Japanese, Korean alone or mixed within those 3 ethnic groups;
 - iii. ASIAN-OTHER: All other single Asian ethnic group or mix within those groups
 - b. Among NHPI only (9 groups based on CHL participating jurisdiction main ethnic groups):

- i. CHAMORRO, CAROLINIAN, CHUUKESE, KOSRAEAN, MARSHALLESE, NATIVE HAWAIIAN, PALAUAN, POHNPEIAN, SAMOAN, YAPESE, and NHPI-OTHER (all other single subgroups of NHPI, e.g., KIRIBATI, TOKELAUN, TONGAN, TAHITIAN, etc.)
- c. Among AIAN only: Due to the small number of sample size, all AIAN sub-ethnic groups are combined into one category as “AIAN”. They may be consisted of a single AIAN ethnic group or a mix of more than one AIAN ethnic group.
- d. Black only;
- e. White only;
- f. A new category is created and named in the following format “MIX_WITHIN_NHPI-PRIORITY ETHNIC GROUP”. Due to sample size, this category is only created for NHPI ethnic groups as sample sizes for other race groups are small. The choice of the priority ethnic group is based first on the main ethnic group of interest that particular jurisdiction where the data is from; If for a jurisdiction where there are more than one priority ethnic groups, then priority is given to the ethnic group which has the largest frequency counts, e.g., Guam has two ethnic groups of interest: Chamorro and Chuukese. The followings are some examples:
 - i. If a child is under category “NHPI-CHUUKESE _NHPI-OTHER” and the data is from Chuuk, we will then treat this as “MIX_WITHIN_NHPI-CHUUKESE”;
 - ii. If a child is under “NHPI-CHAMORRO _NHPI-CHUUKESE _NHPI-PALAUAN” and data is from Hawaii, then we will use the frequency counts rule to set the order of priority. Highest priority will be given to those with the most frequency counts.

II. More than one race group: for those with two or more race groups, or currently under the category of “More than one race” of the variable “*race_new_omb*”.

- a. New categories will be given in the format of “MIX_PRIORORITY ETHNIC GROUP”. Priority is giving use the combination of the following two methods: (1) interesting study ethnic groups depending on the source of

data (Jurisdiction) and (2) frequency counts of each of these ethnic groups if there are more than one ethnic groups. Interesting study ethnic groups for each of the participating jurisdiction are listed as the following:

- i. Palau: Palauan;
- ii. Yap: Yapese;
- iii. Guam: Chamorro, Chuukese
- iv. CNMI: Chamorro, Carolinian
- v. Chuuk: Chuukese
- vi. Pohnpei: Pohnpeian
- vii. Kosrae: Kosraean
- viii. RMI: Marshallese
- ix. Am. Samoa: Samoan
- x. Hawaii: Native Hawaiian
- xi. Alaska: AIAN

b. In general, the order of priority are as the following:

- i. NHPI>AIAN>Filipino>Asian-east>Asian-other>Black>White for all jurisdictions except for Alaska;
- ii. AIAN>NHPI> Filipino>Asian-east>Asian-other>Black>White for Alaska;

c. In some jurisdictions, like Guam and CNMI, there are more than one ethnic groups of study interesting. Under those cases, the priority is given based on frequency counts. The priority order for those three jurisdictions are:

- i. For Guam: Chamorro>Chuukese>other PIs(order depends on frequency counts)>AIAN>Filipino>Asian-east>Asian-other>Black>White;
- ii. For CNMI method one: This method follows the general CHL protocol where the top two priority ethnic groups are Chamorro and then Carolinian with the following order: Chamorro>Carolinian>Chuukese>Other PIs (order depends on frequency counts)>AIAN>Filipino>Asian East>Other PIs>Other Asians>Black>White;

- iii. For CNMI method two: in this method, Carolinians are given the highest priority. If a child is of Carolinian mix with any other ethnic groups, e.g., Chamorro, then she/he is assigned as Carolinian, even though counts of Chamorro are higher than Carolinian. In this method, a new variable, “race_new_pacific_cnmi” is created. For CNMI specific reports, this variable can be used instead. Priority order under this method for CNMI is: Carolinian>Chamorro> Chuukese>Other PIs (order depends on frequency counts)>AIAN>Filipino>Asian East>Other PIs>Other Asians> Black>White;
- III. The variable “*race_new_pacific*” currently has a total of 43 categories. The distribution of this variable by jurisdiction is presented in the attached excel file. This variable can then be used to create new race variable(s) depending on the needs of individual study or research questions. For example, for the manuscript on obesity prevalence in the pacific region, we are planning to create a new variable which will combine any mix groups into that main ethnic groups, e.g., Mix_chuukese will be combined with Chuukese, mix_Hawaiian will be combined with Hawaiian, etc. In this way, there will be no mixed group. We can also think of create a new category as Mixed, which combine all those different mixed groups into one.
- IV. Hispanic. Whether the child is of Hispanic origin is not considered in the creation of new race/ethnicity variables. One of the key reason in doing this is that Hispanic is not one of the focus study group we intended. Nevertheless, there variable “hispanic” (coded 1=yes and 0=no) are there in the data set. In addition, currently there are 27 children indicated they are of Hispanic origin but did not indicate any race/ethnic group among our study participants. If in the future, someone is interested in study Hispanic in the Pacific, he/she can use those available variables to create new ones to address his/her research needs.

Table 7: Created and Calculated Variables from Form 23-02

* Those new variables are also created for FAS prevalence study;

**Created and Calculated Variables from
Demographic and Other Variables from
Information About Your Child And Household: Form 23-02**

Variable Name	Variable Description	Data Type	Length	Response Options / Codes	Notes
New Race/ethnicity variables: Please refer to the section, “Proposed methods for creating a new race_ethnicity variable”, on the description of how those new variables are created					
ethnicity_new	ethnicity_new	Character	250	created in order to capture or reflect a study participant’s race/ethnic composition. This variable is currently in the format of “RACE1-SUBCATEGORIES_RACE 2-SUBCATEGORIES....” in alphabetic order, e.g., “ASIAN-CHINESE_ASIAN-FILIPINO_ASIAN-INDIAN_ASIAN-JAPANESE_ASIAN-THAI_NHPI-CHAMORRO”.	
The following three race/ethnicity variables were created and should be used in the future for exploring race/ethnic differences. Based on the research needs, categories of variables “race_new_pacific” and race_new_pacific_CNMI” can be further combined.					
Race_new_omb	Child’s race following guidelines of US	Character	30	One of the following 6 categories: AIAN (American Indian and	http://wonder.cdc.gov/wonder/help/populations/bridged-race/Directive15.html .

Other created new variables which were created for both FAS prevalence study and intervention jurisdictions baseline and 24-month data sets					
DOB_NEW	Date of birth of the child	Date/Time	8	Format of MMDDYY10.	
SEX_NEW	Sex of the child	Numeric	8	1=Male; 2=Female	
SLEEP_NEW	How many hours of sleep on average does your child get in a 24-hour period (at night and in naps)	Numeric	8	Taking values of 0, 0.5, 1, 1.5, 2, 2.5, 3, 3.5, 4, 4.5, 5, 5.5, 6, 6.5, 7, 7.5, 8, 8.5, 9, 9.5, 10, 10.5, 11, 11.5, 12, 12.5, 13, 1.35; Maximum value is 13.5;	
SLEEP3	Child sleep time in 3 categories	Numeric	8	Three categories: <ul style="list-style-type: none"> • 1=less than 8 hours; • 2=8 hours or more but less than 11 hours; • 3=between 11 to 13 	

**Created and Calculated Variables from
Demographic and Other Variables from
Information About Your Child And Household: Form 23-02**

Variable Name	Variable Description	Data Type	Length	Response Options / Codes	Notes
				hours;	
sleep2yrs	Total hours of sleep among two years old in three groups	Num	8	1='less than 9 hours' 2='9 to less than 11 hours' 3='11 hours or more';	
meeting2yrs_sleep	Does the two-year old child meet national recommendation of sleep during of at least 11 hours a day?	Num	8	1=yes; 0=no;	
sleep3t5yrs	Total hours of sleep among three to five years old in three groups	Num	8	1='less than 8 hours' 2='8 to less than 10 hours' 3='10 hours or more';	
meeting3t5yrs_sleep	Does the three to five-year old child meet national recommendation of sleep during of at least 10 hours a day?	Num	8	1=yes; 0=no;	

**Created and Calculated Variables from
Demographic and Other Variables from
Information About Your Child And Household: Form 23-02**

Variable Name	Variable Description	Data Type	Length	Response Options / Codes	Notes
sleep6t8yrs	Total sleep time in hours among six to eight years old in three groups	Num	8	1='less than 7 hours' 2='7 to less than 9 hours' 3= '9 hours and more'	
meeting6t8yrs_sleep	Does the six to eight-year old child meet national recommendation of sleep during of at least 9 hours a day?	Num	8	1=yes; 0=no;	
sleep6t10yrs	Total sleep time in hours among six to ten years old in three groups	Num	8	1='less than 7 hours' 2='7 to less than 9 hours' 3= '9 and more'	For 24month data set only
meeting6t10yrs_sleep	Does the six to ten-year old child meet national recommendation of sleep during of at least 9 hours a day?	Num	8		For 24month data set only

The following variables were created for intervention jurisdictions baseline data set and FAS prevalence data set only for the purpose of the comprehensive community reports; Hence, 24 month data set does not have any of those variables created yet

**Created and Calculated Variables from
Demographic and Other Variables from
Information About Your Child And Household: Form 23-02**

Variable Name	Variable Description	Data Type	Length	Response Options / Codes	Notes
AGE_BASELINE_NEW	Child age at the interview (both baseline and 24-month)	Numeric	8	This variable was further cleaned after correction of child's date of birth, or date of anthropometry assessment or date of collection of the demo form when date of anthropometry is not available	
RELATION_DEMO_NEW	What is your relationship to this child?	Numeric	8	1='Biological mom'; 2='step mom' 3='adoptive mom' 4='birth dad' 5='step dad' 6='adoptive dad' 7='Legal guardian, caregive, other' 8='grandmother' 10='grandfather' 18='grandparents'; 23='step mom and adoptive mom' 25='step mom or step dad' 36='adoptive mom or adoptive dad' 56='step dad and adoptive dad'	Not yet cleaned for 24 month data set;

**Created and Calculated Variables from
Demographic and Other Variables from
Information About Your Child And Household: Form 23-02**

Variable Name	Variable Description	Data Type	Length	Response Options / Codes	Notes
REL_OTHER_NEW	What is your relationship to this child: Legal Guardian, Caregiver, Other	Character	40	Further cleaned from variable "REL_OTHER"	Not yet cleaned for 24 month data set;
MARITAL_NEW	Respondent current marital status	Character	1	1=Married 2=Divorced 3=Separated 4=Widowed 5=Single and not living with boyfriend, girlfriend, or partner 6=Single and living with boyfriend, girlfriend, partner 7 =Other	Not for 24month yet
MARI_OTHER_NEW	Respondent current marital status-Other	Char	40		
COUNT_MOTHER_NEW	Number of person who currently lives in the child's household -Mother	Num	8		
COUNT_FATHER_NEW	Number of person who currently lives	Num	8

Child Anthropometry

Weight, height, and waist circumference were measured by trained research staff based on standardized procedures and protocols (Lohman, Roche, & Martorell, 1988; Ikeda & Crawford, 2000; CDC, 2006). Child's height, weight, and waist circumference measurements were taken three times at each visit. The results were reviewed right away to ensure that two of the three readings were within 0.2 units of each other (e.g., 0.2 kg for weight). If not, another series of three measurements were taken. This protocol ensured good data quality. Trained CHL staff measured each child's height, weight and waist circumference, respectively using a portable scale, stadiometer, and tape measure. A trained second person recorded the results using the anthropometric recording sheet Form 59-01 and verified with the measurer that the written data were correct.

The Lohman, Roche, and Martorell (1988) Anthropometric Standardization Reference manual was also used in the form* and protocol development. This manual also informed us in the development of a internally-prepared CHL manual based on current standard practice in the field -- CHL Participant Measurement Training Guide. This protocol ensured good data

quality. The Anthropometry form was developed using the Procedure Manual of the National Health and Nutrition Examination Survey (2002). The protocol for reading was adapted from the training module on technique to accurately weigh and measure infants, children and adolescents (Maternal and Child Health Bureau *) as well as The University of California at Berkeley's (2000) *Guidelines for collecting heights and weights on children and adolescents in school settings.* ?*

Zerfas informed our measurement standardization process. Zerfas criteria (*1986) were used to standardize research staff against the height, weight, and waist measurement of a certified anthropometrist, the CHL Principal Investigator, Dr. Novotny. No research staff assessed children for a measure for which they did not pass the Zerfas criteria. Zerfas did not provide any waist circumference criterion; however, Zerfas' criteria for assessments measured in cm (mm) units (height and arm circumference) was applied to waist circumference.

Participants wore lightweight clothing and no shoes, and removed hair bands that added height. Height was measured to the nearest 0.1 cm using portable stadiometers (Perspective Enterprises, PE-AIM-101; Portage MI). Weight was measured to the nearest 0.1 kg using portable scales (Seca Model 876; Chino CA). Plastic tape (Seca Model 201; Chino CA) was used to measure waist circumference at the level of the umbilicus to the nearest 0.1 cm [Lohman et al., 1988]. The parent/ caregiver often assisted to hold up the participant's shirt or by asking the child for permission to hold up their shirt.

Baseline and post-intervention period anthropometry allow us to measure progress toward our objective to decrease the prevalence of young child overweight and obesity by 5%. These measures were used to compute Body Mass Index (BMI) as weight (kg) / height (m)², waist (cm) to height (cm) ratios, and subsequently BMI z-score, waist circumference z-score, BMI-for-age-percentiles, and waist circumference-for-age percentiles (Barlow, 2007; Cook, Auinger, & Huang, 2009).

CHL Protocol for data cleaning and data analysis for Anthropometry Data

The CHL protocol for anthropometry measurement states that each of the anthropometry components (height, weight, and waist circumference) must be taken 3 times regardless of the first 2 measurements being within 0.2 units (cm for height and waist and kg for weight). If no two of the 3 measures are within 0.2 units, the first 3 measures should be crossed out and the entire 3-measures process is repeated. The measurer should repeat the process until there were at least 2

measures within 0.2 units. The measurer was free to continue to obtain more than 3 measures if he/she believed that the first 3 measures were not consistent. A total of 9 variables were given to each of the 3 anthropometry components:

- For height, the 9 variables are:
ht1 ht2 ht3 ht1_v2 ht2_v2 ht3_v2 ht1_v3 ht2_v3 ht3_v3;
- For weight, the 9 variables are:
wt1 wt2 wt3 wt1_v2 wt2_v2 wt3_v2 wt1_v3 wt2_v3 wt3_v3;
- For waist circumference, the 9 variables are:
waist1 waist2 waist3 waist1_v2 waist2_v2 waist3_v2 waist1_v3 waist2_v3 waist3_v3;

The suffix _v2 stands for the second measurement cycle for the 3 measures for any component and the suffix _v3 stands for the third measurement cycle for the 3 measures for any component when needed. Following this protocol, for each of the 3 anthropometry components, a child can have 3, or 6 or 9 measures, a number which is multiplied by 3 and the maximum total number of measure a component can have is 9.

In reality, CHL data revealed dozens of data patterns. For example, some study subjects had only 1 measure or 2 measures of one of those 3 components. When the measuring process needed to be repeated, it is not repeated accordingly to the protocol of 3 other measures per measurement component. As a result, there were study participants who had 4, or 5, or 7 or other numbers rather than a multiple of 3 measures for a measurement components.

The following data cleaning and data analysis protocols are set for the anthropometry data, in particular, for the calculation of BMI, BMI Z score, BMI percentile or other BMI-related variables, and waist-related variables (e.g., waist height ratio) for different case scenarios.

- For study participants with no measure of height, weight, or waist BMI and BMI-related variables, or waist circumference and waist-related variables will be set to missing.
- For study participant with 1 measure of height, weight, and waist

The value of that single measure will be used as the value of that participant's height, weight, or waist circumference, respectively.

- For study participants with 2 or more measures (usually up to 9 measures) of height, weight, and waist Mean value of all available measures of each of the 3 components will be used as the value of that component and be used in the later calculation of BMI, BMI-related variables, waist circumference and waist-related variables. The rationale of this decision is from the experience of anthropometric standardization where low variability in measures was found to lead to more biased results than measures with larger variability.
- In addition, to capture the number of measures each child has for the 3 components and whether among all available measures of any component, there are at least 2 measures within 0.2 units, the following variables are created:
 - ***validity_ht, validity_wt, validit_waist***: all those 3 variables are coded 1 for yes to reflect the fact that there are at least two measures within 0.2 units and coded 0 for no to reflect that fact that no two measures are within 0.2 units among all available measures. Those 3 variables can be used in the future to determine whether an analysis will use all available data or only those whose data is valid (at least 2 measures are within 0.2 units). They can be used in combination with the following variables, ***numbermeasures_ht, numbermeasures_wt, numbermeasures_waist***, in future analysis for specific investigation.
 - ***numbermeasures_ht, numbermeasures_wt, numbermeasures_waist*** : to reflect the number of measures each child has for the 3 components. This variable can be used in the future to determine whether an analysis will include all data, or only data from children with certain number of measures (e.g., n=3). It can be used in combination with the above three variables (***validity_ht, validity_wt, validit_waist***), in future analysis for specific investigation.

Calculation of BMI and BMI-related variables

Once the value of height and weight are determined for a participant, BMI and BMI-related variables are then calculated using CDC's SAS program which uses the 2000 CDC growth charts for ages 0 to <20 years (available at: <http://www.cdc.gov/nccdphp/dnpao/growthcharts/resources/sas.htm>).

For BMI-related variables, including BMIZ, BMI percentile to be calculated, the dataset must include the following variable with the same exact name and the given data format before to run this SAS program:

AGEMOS: child's age in months. This numeric variable may need to be calculated from the date of anthropometry measurement and the date of birth.

SEX: child's gender with 1 for male and 2 for female.

HEIGHT: child's recumbent length or standing height in centimeters. It is a numeric variable.

RECUMBENT: Indicator of child's height measurement with 1 for recumbent length and 0 for standing height. It is a numeric * variable.

WEIGHT: Child's weight in kilograms. It is a numeric variable.

In some cases, study participants may miss information on one or more of those variables. As a result, the total number of study participants may be different from the total number of study participants with a calculated BMI, or other BMI-related variables.

Table 8: Anthropometry Variables, Form 59-01

Anthropometry Variables, Form 59-01					
Variable Name	Variable Description	Data Type	Length	Response Options / Codes	Notes

Anthropometry form was slightly modified for CHL 24 month data collection. Three new fields were added to the form: scale number,

stadiometer number and tape number. Table 9 listed those additional variables.

Table 9: Additional variables from Form 59-01 Anthropometry Measurements for CHL 24 measurement

Anthropometry Variables, Form 59-01					
Variable Name	Variable Description	Data Type	Length	Response Options / Codes	Notes
scale_no		Char	9		
stadiometer_no		Char	9		*in baseline and FAS jurisdictions, the variable is named "stadiometer".
tape_no		Char	9		

Table 10: Created and Calculated Variables Anthropometry

Created and Calculated Variables Anthropometry, Form 59-01					
Variable Name	Variable Description	Data Type	Length	Response Options / Codes	Notes
DOB_NEW	Date of Birth of the child *should be used in any data analysis				
DATE_ANTHR_NEW	Date when anthropometry is measured *should be used in any data analysis	Date/ Time	8	Format of MMDDYY10.	Taking only the date part of the original variable DATE_ANTHR
STADIOMETER_No_NEW	Stadiometer number	Character	9		For some observations, data was corrected and any correction done was reflected in this new variable. The original variable "STADIOMETER" remained unchanged.
TAPE_NO_NEW	Tape number	Character	9		For 24 month data set only;
NUMBERMEASURES_HT	The total number of measures of height	Numeric	8		
VALIDITY_HT	Whether there is at least 2 measures within 0.2 cm	Numeric	8	0=No 1=Yes	
AVG_HT	Mean value of height among all measures	Numeric			
NUMBERMEASURES_	The total number of	Numeric	8		

WT	measures of weight				
VALIDITY_W T	Whether there is at least 2 measures within 0.2 kg	Numeric	8	0=No 1=Yes	
AVG_WT	Mean value of weight among all measures	Numeric			
NUMBERME ASURES_ WAIST	The total number of measures of waist	Numeric	8		
VALIDITY_W AIST	Whether there is at least 2 measures within 0.2 cm	Numeric	8	0=No 1=Yes	
AVG_WAIST	Mean value of waist among all measures	Numeric			
ANTHRO_CH _AGE	Child's age in years when anthropometry was measured	Numeric			Based on the difference in years between child's date of anthropometry measurement and date of birth
AGEMOS	Child's age in months when anthropometry was measured	Numeric			Based on the difference in months between child's date of anthropometry measurement(DATE_ANTHR_NEW) and date of birth(DOB_NEW)
ANTHR_AGE 2GRP	Child's age in two groups			The two categories: <ul style="list-style-type: none"> • 2-5 • 6-8 (6-10 for 24 month data sets and the combined data set) 	
ANTHR_AGE 7GRP	Child's age in single year age			The seven categories:	For 24month data sets and the

	group			<ul style="list-style-type: none"> • age2 • age3 • age4 • age5 • age6 • age7 • age8 	combined data sets, this variable is called anthr_age9grp(age2, age3, age4, ... age10).
METHODS_H T	Methods used for height measurement	Character	20	2 categories: Stadiometer and Rafter	Rafter method was only used for a total of 12 children from Kenai during baseline measurement in Alaska

The following BMI and other related variables are calculated based on CDC 2000 reference using the CDC's sas program:

BMI_CATEG ORY	Bmi in 4 categories using CDC 2000 reference	Character	1	4 categories: 1=underweight 2=Overweight 3=Obese 4=Healthy weight	* Underweight: bmi<5 percentile; Healthy weight: 5% to 84% of bmi; Overweight : 85 to 94% percentile; Obese: >=95% bmi
OBESE	Is the child obese or not?	Num	8	1=yes; 0=no;	
OVERWT	Is the child overweight or not?	Num	8	1=yes; 0=no;	
UNDERWT	Is the child underweight or not?	Num	8	1=yes; 0=no;	
HEALTHYWT	Is the child of healthy weight or not?	Num	8	1=yes; 0=no;	
OWOB	Is the child overweight/obese or not?	Num	8	1=yes; 0=no;	
WT_ANTHRO	Unadjusted weight calculated for each community/child	Num	8		calculated for sample weights
WT_ANTHRO _ADJ	Adjusted weight calculated for each community/child	Num	8		calculated for sample weights
JURISNUM	Jurisdiction code	Num	8		calculated for sample weights
COMMNUM	Community code	Num	8		calculated new variables from form 23-02 (DEMO)
ABDOMINAL	Using CHL data	Num	8	1=yes; 0=no	cutoff value is >=

_OBESITY_C HL	set as a reference data set				71.4667cm of mean waist circumference; *only calculated for intervention jurisdictions baseline data sets and FAS prevalence data sets;
ABDOMINAL _OBESITY_I DF	Using average of values of boys and girls at 8 years old as reported by the IDF report	Num	8	1=yes; 0=no	Cutoff value is >=67.65cm of mean waist circumference * only calculated for intervention jurisdictions baseline data sets and FAS prevalence data sets;

Diet of Children - Food and Activity Log -

In process – more to be added.

To collect information about food and beverage intakes of the children participating in CHL, the dietary record method was used. This method can be very useful when detailed information is recorded. The dietary record administered at time one for the intervention jurisdictions and at time one for the prevalence jurisdictions included collection of physical activity; thus, the tool was referred to as the “food and activity log” or FAL. The FAL was based on the Food and Physical Activity record used for Dr. Novotny’s study Pacific Kids DASH for Health and the dietary records used in the dietary data collection conducted by Dr. Boushey as part of the CoASTAL cohort. Parents were asked to complete two days of food and activity logs (FAL) at baseline. These logs were used to estimate dietary intake over the two randomly assigned days. The information gathered in “real time” was used to measure progress toward the CHL objectives of increasing fruits and vegetables and water; and reducing sugar-sweetened beverages. From two 24-hour periods, the data will estimate foods and beverages and amounts each child consumes.

Additional data collected in the FAL for Freely Associated States (FAS)

The FAL used for the FAS jurisdictions differed from the FAL used in the intervention jurisdictions study. Unique to the FALs used in the FAS with regard to data collection was the request to provide source information for all foods and water used as single items and as ingredients in prepared dishes. Examples of sources were provided in the FAL and shown below in Table 11. The FAL for the FAS jurisdictions included an additional portion size estimation aid for fish. Pictures of fish were included in the FAL representing three portion sizes by whole fish and cut pieces of fish. The additional aids for estimating fish intake were provided due to the importance of fish in the diet among the FAS jurisdictions.

Table 11: Examples of Source of Food on FAL in FAS

Purchase	Communal/gift/donation	Local labor or self-labor
Supermarket	Food bank / food pantry	Fishing
Restaurant	Field trip	Hunting
Road side stand / stall	Church gathering	Home garden
Convenience store	Government assisted	Personal farm
Grocery store	Gift from friend/relative	Community garden
Farmers' market	USDA Commodities	Commercial farm
Lunch wagon / food wagon	Funeral	Ocean gathering
Fish markets	Traditional event	Animal husbandry
Merchant/Cargo		Specify: non-purchase

PacTrac3

The Pacific Tracker 3 (PacTac3) database and web application is a modification of the MyPyramid Tracker developed by the U.S. Department of Agriculture's (USDA) Center for Nutrition Policy and Promotion and the PacTrac2 modification by the UH Cancer Center and the Human Nutrition, Food and Animal Science (HNFAS) department (Murphy S, Blitz C, & Novotny R, 2006). PacTrac2 modified the MyPyramid Tracker for collection of dietary data in the Pacific islands. Two modifications had been made to the existing MyPyramid Tracker: 1. The addition of a function to save entered data and allow data to be accessed at a later date. 2. The addition of foods specific to the diets of the Pacific Islands' populations. PacTrac2 was modified for use in CHL and was designated as PacTrac3. This tool was used to input and analyse data collected from the food records.

Pac Trac 3 generates two data tables that can be used for data analysis. The "heh" table includes derived food groupings, energy, and nutrients based on information

recorded on the Food and Activity Log (FAL) and entered by CHL staff into PacTrac3. The heh file has one or two record days along with the dates of each record day per CHL ID. The “hei” table contains the names of the foods and beverages recorded on the FAL by the parents or caretakers. There is one data row per food/beverage entered associated with the user ID, record date, record time, and other relevant variables. The University of Hawaii Cancer Center’s Nutrition Support Shared Resource (NSSR) Food Composition Table (FCT) was used in PacTrac3.

Most participants have records over two days at – baseline and/or post-intervention period. The index d1 or d2 at the end of each variable indicates the record is for day 1 or day 2 of each visit. Variable **heh_visit_no** tells which visit the data were associated with.

Average 2 day Variables for Nutrients. If only data from a certain visit are needed, use variable *heh_visit_no* (values 1 to 2) to the particular visit number of interest.

Weighted Variables for Nutrients. If only data from a certain visit are needed, use variable *heh_visit_no* (values 1 to 2) to the particular visit number of interest.

The following variable tables from the FAL are from the UH Nutrition Support Shared Resource (NSSR).

Energy and Nutrients

Assessments

This table contains the user’s nutrients intake assessments. One record per user ID and record date.

FIELD	DATA TYPE	DESCRIPTION
userid	varchar(255)	user ID
rec_date <i>(was entrydate)</i>	varchar(20)	Record/recall date (MM/DD/YYYY) <i>The date when the foods were consumed</i>
aprot	int	Assessment for protein intake

Measure_Description

This lookup table contains household measurements information.

FIELD	DATA TYPE	DESCRIPTION
Measure_Code	int	Household measurement code
Description	nvarchar(255)	Household measurement description

Measure_Code	Description
0	None
10000	1 cup, Better Cheddars
10001	1 cup, Boston Baked Beans
10002	1 cup, Cheez-its
10003	1 cup, Chiclets
10004	1 cup, Goobers
10005	1 cup, Graham Bites
10006	1 cup, Jimmies
10007	1 cup, Jordan
10008	1 cup, Krunch Twists, crushed
10009	1 cup, Krunch Twists, loose
10010	1 cup
10011	1 cup, NS as to fresh or frozen
10012	1 cup
10013	1 cup, NS as to variety
10014	1 cup, Ripplin's Potato Snack Chips
10015	1 cup, Squirrel Nuts
10016	1 cup, Teddy Grahams
10017	1 cup, Thin Bits
10018	1 cup, Toll House
10019	1 cup, acorn
10020	1 cup, acorn, crushed

Table 12: HEI Variables

This table includes derived food groupings and nutrients based on information entered by the user. There is one record per user ID and Record / Recall date.

NOTE: *This table has been modified to save pyramid servings.*

Table 13: HEI Healthy Eating Index Created Variables from PacTrac3

NOTE: REC_TIME was added to make multiple entries of same the food for the same day possible.

FIELD	DATA TYPE	DESCRIPTION
userid	varchar(255)	User ID
rec_date (was entrydate)	varchar(20)	Record/recall date (MM/DD/YYYY) The date when the food was consumed
rec_time	varchar(8)	Record/recall time (HH:MM AM/PM) The time when the food was consumed 12:01 AM – If time was not entered or wrong format entered
Food_Description	varchar(255)	Food description
code	int	Food code
subcode	bigint	Sub code
servingcode	int	Serving type code
quantity	float	Number of serving(s)
location_prepared	varchar(50)	Location where the food was prepared
location_consumed	varchar(50)	Location where the food was consumed
concurrent_activity	varchar(50)	Concurrent activity while consuming the food
detailed_desc	varchar(255)	Participant's detailed description of the food item
entry_ID	varchar(3)	Data entry person's initial UNK – if initial is not entered
entry_datetime	datetime	Date and time when the physical activity record was entered to the system (Hawaii Time since the server is located in Hawaii)

Comment [BP2]: Not in dataset pulled from SAS 12/21/16

mod_ID	varchar(3)	Data entry person's initial when the activity entry was last modified UNK – if initial is not entered
mod_datetime	datetime	Date and time when the physical activity record was last modified (<i>Hawaii Time since the server is located in Hawaii</i>)
Community	Num(8)	Community
Foodcode	Num(8)	Food code for CHL only
id	Num(8)	Child ID
jurisdiction	Num(8)	Jurisdiction (1=Palau, 2=Yap, 3=Guam, 4=CNMI, 5=Chuuk, 6=Pohnpei, 7=other, 8=Yap, 9=Am Samoa, 10=HI, 11=AK)
time	Num(8)	Measurement Number (1=Baseline or Prevalence, 2=24 Month)
unit_of_measure	varchar(78)	Unit of measure for food (e.g., cup, slice)

UserAccounts

(This table has IT information that may not be needed in the Data Dictionary?)

This table contains user login information.

FIELD	DATA TYPE	DESCRIPTION
Username	varchar(255)	User name
PasswordHash	varchar(40)	Encrypted password using the random set of charactes in the salt field
salt	varchar(10)	Random set of characters that will be used to encrypt the user password
logincount	int	Number of times the user logged in
logintime	datetime	Last date and time the user logged in

UserName	PasswordHash	salt	logincount	logintime
test001	830762ADC6A4D4	BNxc2E/8	4	8/24/2011

userdata

(Some of the IT information in this table may not be needed in the Data Dictionary?)

This table contains user information provided during registration

userid	email	age	gender	height	weight	pwdhint	zipcode
test001	test001@test.com	30	m	62	140	test001	96712
user999	user999@user.com	25	f	62	120	user999	96797

FIELD	DATA TYPE	DESCRIPTION
userid	nvarchar(255)	User ID
email	nvarchar(255)	E-mail address
age	int	Age
gender	char(1)	Gender : <i>m – male, f – female</i>
height	int	Height in inches
weight	int	Weight in pounds
pwdhint	varchar(255)	Password Hint
zipcode	int	Address Zipcode

Physical Activity

Physical Activity – Food and Activity Logs

In process – more to be added.

****As of 8/31/2016 variables for the Physical Activity section of the Food and Activity Logs are not available for request**

Parents were asked to complete a record of their child's activities for two days. The activity log in conjunction with the use of the accelerometer provided more specific information about the type of activity the child was doing.

PacTrac3 was developed from MyPyramid Tracker (cnpp.usda.gov/MyPyramidTracker.htm) with added metabolic equivalents (METS) for children (Ridley, Ainsworth, & Olds, 2008), research functionality to manage output, and local/traditional activities, such as surfing. Thus, we can quantify child physical activity in MET-adjusted minutes per day, from two days of physical activity logs per child.

***Insert PacTrac3 activity variables**

PacTrac3 **physical activity** related data sets: pah (physical activity), peer (Percentage of Estimated Energy Requirement).

fpa

This table contains **frequently performed activities** saved by the user. These saved activities are meant to make for future entries easier.

FIELD	DATA TYPE	DESCRIPTION

Physical activity – Accelerometry

****As of 8/31/2016 variables from accelerometry are not available for data request.**

Objective Measurement of Physical Activity – Accelerometry. Accelerometers have become an important tool to objectively monitor physical activity in free-living conditions. Triaxial accelerometers measure vertical, horizontal and lateral acceleration and raw data can be analyzed to provide an objective measure of the intensity, duration and frequency of physical activity throughout the day. The detected accelerations are filtered, converted to a numerical value and summed over a specified time interval or epoch. The recorded counts for each epoch can be used to represent the intensity of the physical activity. Children's physical activity tends to be intermittent and characterized by rapid changes from rest to vigorous physical activity. In order to accurately quantify physical activity intensity and duration, short (<30 secs.) epoch durations are necessary (Baquet, 2006; Nilsson, 2002).

These monitors store data over long periods, allowing analysis of patterns of physical activity in free-living subjects over the course of several days to weeks. The small size of the device is unobtrusive and allows monitoring of subjects without interfering with normal movement. Several studies including our own unpublished CHL Physical Activity Pilot have concluded that accelerometers can be effectively used in free-living children to measure levels of physical activity (Troost, 2002; Freedson et al., 2005; Hoos et al., 2003). In addition, relatively short periods of monitoring (4-7 days) have been found to be reliable (Troost, 2000).

Accelerometers measured physical activity in young children. Accelerometers provide data of different intensities, including inactivity during waking hours, making them ideal for lifestyle interventions or interventions not specific to a location. This approach allowed us to obtain objective measures for sleep, sedentary behavior and physical activity at different intensities. Each participant was asked to wear an accelerometer for six days. We used accelerometry for about 100 participants per each intervention and comparison community as well as at all FAS sites in a subset of the study population (50%; n of around 100 per jurisdiction). The accelerometer data were processed using the manufacturer's software and its output is in activity in counts/minute.

CHL protocols for Actical Accelerometer Data

CHL participants were expected to wear the Actical accelerometer for six consecutive days. In general, the Actical accelerometer was placed on the child on day 1 and removed on day 7. For each day, a child's activity was recorded from 0:00:00 a.m. in the morning to 23:59:59 p.m., which sums to 1440 minutes. Occasionally, a child might have had his/her accelerometer removed on some day(s) during the week and later have had the accelerometer placed back on. For these children, their accelerometer data may show as non-consecutive days. These types of data will be identified during the data cleaning and data analysis stages and the following rules will be applied.

The CHL protocol for Actical accelerometer data cleaning and data analysis includes the following 3 rules:

1. To be included in the data analysis, the Actical accelerometer data of each day must be valid. The criteria for valid data for each day are: the total number of minutes for any one single type of activity must not exceed 1300 minutes (90% of the time). If the total number of minutes for any single type of activity during a day was 1,300 minutes or greater (90% or over of the time), then data for that day was excluded from data analysis.
2. The data analysis is based on all valid days of data. The days with valid data are not required to be consecutive, even though for the majority of children, the days are consecutive. If a child has 3 or more days of valid data, the total minutes of different types of activities should add up to 1440 minutes for each of the first few days (e.g., day 1 – 2 for those with 3 days of valid data) and only the last day's (e.g., day 3) total minutes may or may not add up to 1440 (minutes). This will depend on the time when the accelerometer was placed and removed from the child.
3. Data from the first day a child wore the Actical was excluded from data analysis in order to avoid potential reactivity effects of children wearing the Acticals. Data from the last day a child wore the Actical was also excluded because it may not have complete data (e.g., 1440 minutes) for that day. As a result, to be included in this data analysis, the participants need to have at least 3 days of valid Actical accelerometer data.

As a result, based on the rules above, if a child has only 3 days of valid Actical data, only data from the second day is included in the analysis. If a child has 4 days of valid Actical data, only data from the second and third day are included. If a child has 5 days of valid Actical data, then only data from day 2 to day 4 are included. If a child has 6 days of valid Actical data, then only data from day 2 to day 5 are included. If a child has 7 or more than 7 days of valid Actical data, only data from day 2 to day 6 will be used in the data analysis. Data from the remaining days are kept in the database but are not used in this data analysis. A new variable, **days_Actical_data**, was created to reflect the number of days of Actical data each child had.

Consequently, the total number of Actical data files uploaded to the CHL server by each Jurisdiction may not match the final number of Acticals included in data analysis.

For this data analysis, the major statistic of interest from the Actical Data is the weighted average minutes per day at the various activity levels (e.g., sedentary, light, moderate, and vigorous). The steps that were followed to compute this statistic are below.

Counts per minute (cpm) were first calculated by summing the counts per second within that minute as recorded by the accelerometer. Accelerometer data were then summarized every minute into 4 activity levels using the following rules (as recommended by Actical):

- sedentary, if $\text{cpm} \leq 40$
- light, if $41 \leq \text{cpm} \leq 2295$
- moderate, if $2296 \leq \text{cpm} \leq 6815$
- vigorous, if $\text{cpm} \geq 6816$

The number of minutes on each day spent in each of the 4 activities is then calculated as the sum of minutes from 0:00:00 am to 23:59:59 pm assigned to that category. Sleeping activity cannot be evaluated by accelerometer data. Descriptive data from the child's Food & Activity Log can be used in the future to validate accelerometer sleep data and to sort out sleeping activities.

A weighted average for each of the 4 activities was then calculated for each child based on the number of valid days of Actical data available and the number of weekdays or weekend days included. For data analysis, after excluding data from the first day and the last day, the minimum number of days of valid data a child may have is 1 and the maximum days of valid data a child may have is 5. For those participants with only 1 day of valid data to be included in the analysis, that single day's value is treated as the weighted average. For those participants with 2 days of valid data to be included in the analysis, the simple average is treated as the weighted average if both days are weekdays or both are weekend days. For those participants with 2 days of valid data with at least one weekday and one weekend day, a weight of 5 (i.e., number of weekdays) is given to the weekday data while a weight of 2 (i.e., number of weekend days) is given to the weekend day data. The weighted average is then calculated as the sum of the weighted week day and weekend day data divided by 7. The formula for calculating a participant's weighted average for 2 days of valid data is below:

$$\text{Weighted average} = \frac{(5 \times \text{value of weekday}) + (2 \times \text{value of weekend})}{7 \text{ (days of the week)}}$$

If a child has more than 2 days of valid data to be included in the analysis, e.g., 3 to 5 days, the simple average is taken if all days are weekdays. If there is at least one weekday and at least one weekend day, then the formula for the weighted average is modified as follows:

$$\text{Weighted average} = \frac{(5 \times \text{mean of weekdays}) + (2 \times \text{mean of weekend})}{7 \text{ (days of the week)}}$$

The weighted average of moderate or vigorous types of activities (*weighted_mv*) is calculated as the sum of the weighted average of moderate activities and weighted average of vigorous activities per child. This is equivalent to the weighted average of the daily minutes of moderate or vigorous activity. A dichotomous variable (*pameet*) was created to assess whether the child meets the national standard of 60 minutes a day of moderate or vigorous activities. It is coded 1 for yes and 0 for no.

Accelerometer Data Variables

Although all participants are expected to have the Actical placed on day 1 and removed on day 7, because of schedule conflicts or other issues, a child may wear the Actical for less than 1 day or more than 7 days. The CHL protocol requests to keep the participant's data up to 10 days. Data from any additional days, e.g., day11, day 12, etc. were not included in the final data set.

For Actical accelerometer final data set, the following variables were kept or created from the accelerometer data:

- (1) date when Actical is placed on or worn, in the format of *day_i*, where *i* takes the value of 1 to 10; For example, variable ***day1*** means the date of the first day when Actical was placed on the child, ***day2*** means the second day since Actical was placed on the child, etc.
- (2) minutes of light, sedentary, moderate, vigorous, moderate and vigorous types and total minutes of all 4 types of activities per day, in the format of *minutes_{type} of activities_{day_i}*, where type of activities include light, sedentary, moderate, and vigorous types of activities as reflected/captured by the Actical Accelerometer; *i* takes the value of 1 to 10. For example, you will see variables like ***minutes_light_d1*** (minutes of light type of activities), ***minutes_sedentary_d1*** (minutes of sedentary type of activities), ***minutes_moderate_d1*** (minutes of moderate type of activities), ***minutes_vigorous_d1*** (minutes of vigorous types of activities), ***minutes_mv_d1*** (minutes of moderate and vigorous types of activities), ***minutes_total_d1*** (total minutes of activities as recorded by the Actical Accelerometer), etc.;
- (3) weighted average of the 4 different types of activities, as well as moderate and vigorous types of activities and weighted average of all types of activities, in the format of ***weighted_type of activity*** (e.g., light, sedentary, moderate, vigorous, total).

Please refer to the section on protocols of accelerometer data clean and analysis for more information on how minutes of various types of activities per day and weighted average of each type of activity per participant were calculated.

Table 14: Actical Accelerometer Data Variables

Actical Accelerometer Data Variables					
Variable	Variable Description	Data Type	Length	Response Options/ Codes	Note
days_actical_data	Number of days with Actical data	Numeric	8	1 to 10	*Newly created variable
day1	Date of the first day when Actical accelerometer was placed on the participating child	Numeric	8		
day2	Date of the second day since Actical accelerometer has been placed on the participating child	Numeric	8		
day3	Date of the third day since Actical accelerometer has	Numeric	8

WEIGHTED_MV_HM	Weighted daily average in hours of moderate or vigorous PA	Num	8		

Sedentary Behavior (SB) / Screen Time (ST)

This “Lifestyle Behavior” tool was adapted to help measure one of CHL’s objectives -- to decrease sedentary behavior, that is recreational screen time by 10 min/day. The measure was modified to include active and inactive video games. It was adapted from Buckworth, J., & Nigg, C. (2004); Nigg, C. R. (2005); Haas, S., & Nigg, C. R. (2009).

Table 15: Sedentary Behavior / Screen Time Variables, Form 23-04

Sedentary Behavior: SEDBH Form 23-04					
Variable Name	Variable Description	Data Type	Length	Response Options/ Codes	Notes
ID	CHL subject ID	Character	7	The first two numbers must be from 01 to 11, the third number must be one from 1 to 6, the fourth number must be one from 1, 2, or 3 and the last 3 numbers are from 1 to 200.	Set as a primary key. Format is in the form of JCY### where JJ is a number for jurisdiction, C is the number for each community in a jurisdiction, Y is the year of measurement, and ### is a number from 1 to the number of enrollees per community.
DATE_SEDBH	Date of Interview	Date	10		Format should be MMDDYY10.

Sedentary Behavior: SEDBH Form 23-04

Variable Name	Variable Description	Data Type	Length	Response Options/ Codes	Notes
COLLECTION_NO	Time (year) when the measurement is taken	Character	1	1=Baseline 2=24 months into intervention or Post-intervention	This variable is not from the form but added to differentiate data from different collection time
CHECKER_SEDBH	Initials of person who checked the form	Character	3		
WEEKDAY_TV	On usual weekdays (Monday to Friday), how long on average a day does your child spend watching Television and/or videos/DVD?	Character	3	0, 0.5, 1, 1.5, 2, 2.5, 3, 3.5, 4, 4.5, 5, 5.5, 6, 6.5, 7+	Please select only one. Measurement unit is in hour (h.). If missing, 9.9 will be assigned.
WEEKDAY_INACTIVE	On usual weekdays (Monday to Friday), how long on average a day does your child spend playing INACTIVE video games (DS, Play station, XBOX, Wii computer games, etc.)?	Character	3	0, 0.5, 1, 1.5, 2, 2.5, 3, 3.5, 4, 4.5, 5, 5.5, 6, 6.5, 7+	Please select only one. Measurement unit is in hour (h.). If missing, 9.9 will be assigned.
WEEKDAY_	On usual weekdays (Monday to Friday), how	Character	3	0, 0.5, 1, 1.5, 2, 2.5, 3, 3.5, 4, 4.5, 5, 5.5,	Please select only one. Measurement unit is in

Sleep

The “Sleep Questionnaire” tool was modified from The Tayside children’s sleep questionnaire (McGreavey, Donnan, Pagliari, & Sullivan, 2005). One modification was to replace the word sleep “problem” with sleep “behavior” due to concerns and feedback in field testing that some of these behaviors have different meanings to some cultures in our jurisdictions. The demographic form asks about amount of sleep. Sleep quality and duration is considered a functional outcome or a secondary outcome of obesity.

Table 17 : Sleep Variables, Form 23-05

TCSQ	Total score of the Tayside Children's Sleep questionnaire	Numeric	8		Maximum score is 36
DIMS	Does the child has disorders of initiating and maintaining sleep?	Numeric	8	1=yes; 0=no	If TCSQ>=8 then DIMS coded as 1;

Acanthosis Nigricans Screening (Form 52-09)

Acanthosis Nigricans is a skin condition characterized by dark, velvety skin in the body folds and creases such as the armpits, groin, and neck. (Burke, Hale, Hazuda, & Stern, 1999). It is often associated with conditions that raise insulin levels such as obesity, Polycystic Ovarian Syndrome, and Cushing's syndrome; it is a risk factor for type 2 diabetes. Acanthosis nigricans is considered a functional and secondary outcome of obesity.

CHL measurement staff will be trained to identify acanthosis nigricans, a possible early indication of insulin resistance and pre-diabetes. Each child's neck will be examined at baseline and post-intervention period. Two trained research staff examine child participants' necks for the presence of acanthosis nigricans (AN). Using Burke's quantitative scale for AN, staff will rate each child on a scale for Acanthosis Nigricans severity: 0 to 4 [68]. Staff marks their rating on the recording sheet Form 59-02. Participants with a score of one or higher are considered to have AN. AN is independently associated with hyperinsulinemia, an important risk factor for type 2 diabetes [69].

These measurements will allow us to measure progress toward our objective of decreasing Acanthosis Nigricans by 5%.

Acanthosis Nigricans referral. Parents/caregivers of participants with a positive screen for AN are provided a referral to follow-up with their children's health care providers or a public health service provider. If staff observes that a child might have acanthosis nigricans, they will talk to the parent in private and present a written referral for their child to see a medical professional. The referral form was used to refer positive children to local medical attention. Each jurisdiction identified the most appropriate referral options for their community.

Table 19: Acanthosis Nigricans Screening Variables

Acanthosis Nigricans (AN) Screening Variables, Form 59-02					
Variable Name	Variable Description	Data Type	Length	Response Options / Codes	Notes
ID	CHL subject ID	Character	7	<p>The first two numbers must be from 01 to 11, the third number must be one from 1 to 6, the fourth number must be one from 1, 2, or 3 and the last 3 numbers are from 1 to 200.</p> <p>Maybe the id numbers can be pre-loaded.</p>	<p>Set as a primary key.</p> <p>Format is in the form of JJCYY### where JJ is a number for jurisdiction, C is the number for each community in a jurisdiction, Y is the year of measurement, and ### is a number from 1 to the number of enrollees per community.</p>
DATE_AN	Date Acanthosis form is filled in	Date	10		Format should be MMDDYY10.

Acanthosis Nigricans (AN) Screening Variables, Form 59-02

Variable Name	Variable Description	Data Type	Length	Response Options / Codes	Notes
STUDY_YEAR	Study year when the measurement is taken	Character	1	1=Baseline 2=24 months into intervention or Post-intervention (year 2)	This variable is not from the form but added to differentiate data from different collection time Maybe this variable should be added to the form?
MEASURER_AN	Initials of person who performed the measurement	Character	3		
CHECKER_AN	Initials of person who checked the measurement	Character	3		
SEVERITY_AN	Severity of acanthosis nigricans on	Character	1	0= Absent 1= Present	

Acanthosis Nigricans (AN) Screening Variables, Form 59-02

Variable Name	Variable Description	Data Type	Length	Response Options / Codes	Notes
	the back of neck			2= Mild 3= Moderate 4= Severe 9=missing	
REFERRED_AN	Is a referral made for this child?	Character	1	0=No 1=Yes 9=Missing 8=Unknown	Refer to Log 3 Acanthosis Nigricans Referral to find the needed information
COMM_AN	Related comments on this measurement regarding this child.	Character	255		

Calculated variables for the AN forms.

*This variable is only calculated for Intervention jurisdictions baseline datasets and FAS prevalence study. For 24 month data, this variables is not calculated yet;

Acanthosis Nigricans (AN) Screening Variables, Form 59-02

Variable Name	Variable Description	Data Type	Length	Response Options / Codes	Notes
AN	Is the child assessed to have Acanthosis nigricans present?	Numeric	8	1=yes (if severity of AN is assessed as 1 to 4); 0=no	

Culture (Form 23-03)

The “Culture” questionnaire” (Form 23-03) assesses native peoples’ ethnic and American mainstream affiliation in line with a bidimensional assumption of ethnic identity in U.S dominated/controlled societies. Stronger empirical support for considering it as a bidimensional construct exists rather than unidimensional (Kaholokula, Grandinetti, Keller, Nacapoy, Kingi, and & Mau 2012; Kaholokula, Iwane, & Nacapoy 2010; Kaholokula, Grandinetti, Nacapoy, & Chang 2008).

Degree of participant’s own group’s cultural and US mainland cultural identifications were assessed using an accuration questionnaire originally designed for use with Native Hawaiian (Kaholokula, Grandinetti, Nacapoy and Change, 2008). The questionnaire consists of 2 subscale: a 4-item participant’s native culture identify subscale (NCIS) and a 4-item US mainland culture identity subscale (MCIS). The two subscales assess the four same aspects of Native/Own group and US mainland cultural identifies: Knowledge about each cultural group, degree of involvement with, feeling towards and associations with each cultural group. A 5-point response scale, ranging from 1 (very knowledgeable; very involved; very positive; mostly of the time) to 5 (not at all knowledgeable; not at all involved; very negative; not at all associated) was used for each item.

The original 8 variables in the data set gives a “5” to very knowledgeable, very positive, or very involved and a “1” to not knowledgeable, very negative, or disinterested. Eight new variables were created to reserve the score so that the scoring pattern matches with the literature. A total score was created for each of those two subscale (variable names: NCISand MCIS) by summing the scores of the 4 items, which ranges from 4 to 20, with lower score indicated a stronger identity. Scores <=12 on each subscale (median score 12, range 4-20) indicated higher levels of affiliation. **NCIS and MCIS scores were calculated only for subjects who had complete information for the two 4-items associated with that subscale.**

A categorical variable, “ACCULTURATION” was created with four categoris: Integrated, traditional, assimilated, and marginalized.

Table 20: Culture Variables, Form 23-03

Culture Variables, Form 23-03					
Variable Name	Variable Description	Data Type	Length	Response Options / Codes	Notes
ID	CHL subject ID	Character	7	The first two numbers must be from 01 to 11, the third number must be one from 1 to 6, the fourth number must be one from 1, 2, or 3 and the last 3 numbers are from 1 to 200.	Set as a primary key. Format is in the form of JJCY### where JJ is a number for jurisdiction, C is the number for each community in a jurisdiction, Y is the year of measurement, and ### is a number from 1 to the number of enrollees per community.
DATE_CUL	Date of Interview	Date	10		Format should be MMDDYY10.
Collection_NO	Time (or year) when	Character	1	1=Baseline	This variable is not

ENTRY_INTERVENTION		Character	3		
COMMENTS		Character	255		

Variables from Screen Form (baseline) which was intergrated into the Demo Form at 24-month (post-intervention) data collection

Prior to participating in the study but after the consent process, CHL staff asked the parents screening questions for each child that was to be enrolled. Those questions were added to the demo form for 24 month data collection

Table 23: Screening variables

Screening Variables					
Variable Name	Variable Description	Data Type	Length	Response Options / Codes	Notes
ID	CHL subject ID	Character	7	The first two numbers must be from 01 to 11, the third number must be one from 1 to 6, the fourth number must be one from 1, 2, or 3 and the last 3 numbers are from 1 to 200.	Set as a primary key. Format is in the form of JJCY### where JJ is a number for jurisdiction, C is the number for each community in a jurisdiction, Y is the year of measurement, and ### is a number from 1 to the number of enrollees per community.
DATE_SCREEN	Date of Screening	Date	10		Format should be MMDDYY10.
COLLECTION_NO	Time (or year) when the measurement is taken	Character	1	1=Baseline 2= 24 months into intervention or Post-intervention	This variable is not from the form but added to differentiate data from different collection time

Screening Variables

Variable Name	Variable Description	Data Type	Length	Response Options / Codes	Notes
CHECKER_CUL	Initials of person who checked the form	Character	3		
PROBLEM_LEADS_TO_INACTIVITY	Q1. Does your child have any problems that keep him/her from being physically active.	Character	2	0=No 1=Yes 99 = Missing	
PROBLEM_SPECIFY_LEADS_INACTIVITY	If yes to Q1, What type of problem?	Character	100		Only if answered Yes to variable "PROBLEM_LEADS_TO_INACTIVITY"
HEART	If yes to Q1, has your child had any problems with her/his heart?	Character	2	1=Yes 99 = Missing	
BLOOD_PRESSURE	If yes to Q1, has your child had any problems with her/his blood pressure?	Character	2	1=Yes 99 = Missing	
BONES_JOINTS	If yes to Q1, has	Character	2	1=Yes	

Screening Variables

Variable Name	Variable Description	Data Type	Length	Response Options / Codes	Notes
	your child had any problems with her/his bones or joints?			99 = Missing	
NERVES	If yes to Q1, has your child had any problems with her/his nerves?	Character	2	1=Yes 99 = Missing	
THYROID	If yes to Q1, has your child had any problems with her/his thyroid?	Character	2	1=Yes 99 = Missing	
CANCER	If yes to Q1, has your child had any problems with her/his cancer?	Character	2	1=Yes 99 = Missing	
LIVER	If yes to Q1, has your child had any problems with her/his liver?	Character	2	1=Yes 99 = Missing	
KIDNEY	If yes to Q1, has your child had any	Character	2	1=Yes	

Screening Variables

Variable Name	Variable Description	Data Type	Length	Response Options / Codes	Notes
	problems with her/his kidney?			99 = Missing	
DIABETES	If yes to Q1, has your child had any problems with her/his diabetes?	Character	2	1=Yes 99 = Missing	
PROBLEM_MISSING	Said child had problem in Q1, but did not specify type of problem in checklist	Character	2	99=Missing	Only if Q1 was yes, and none of the health problems were checked.
MEDS	Child takes medications	Character	2	0=No 1=Yes 99 = Missing	
ANTIDEPRESSANTS	Q4???	Character	2	1=Yes 99 = Missing	
LITHIUM		Character	2	1=Yes 99 = Missing	
APPETITE_SUPPRES		Character	2	1=Yes 99 = Missing	
OTHER_MED_AFFECT_APPETITE_METABOLISM		Character	2	1=Yes 99 = Missing	

Screening Variables					
Variable Name	Variable Description	Data Type	Length	Response Options / Codes	Notes
TAKE_MEDS_REGULARLY		Character	2	0=No 1=Yes 99 = Missing	
DATE OF DATA ENTRY		Date			MMDDYYYY
DATA ENTERERS INITIALS		Character	3		
DATA ENTERER COMMENTS		Character	100?		

Jurisdiction, Community, and Intervention Group Codes

The following table provides the response codes for the jurisdictions and communities that participated in CHL.

Table 24: CHL Jurisdiction and Community Codes

CHL Jurisdiction and Community Codes Created Variables			
Variable	Variable Description	Data Type	Response Options / Codes
JURISDICTION	Participant Jurisdiction	Character	1=Palau 2=Yap 3=Guam 4=CNMI 5=Chuuk 6=Pohnpei 7=Kosrae 8=RMI 9=American Samoa 10=Hawaii 11=Alaska
COMMUNITY	Participant community	Character	11=Airai_Olbedekall 12=Koror(Madalaii, Meyuns, Ngerbeched, Ngermid) 13=Melkeok 14=Ngaraard_Ngeremlengui 21=Rull(Beleau and Ganelay ELM/YICS) 22=Rumuu

HOUSEHOLD INFORMATION (OTHER)

5. What is the highest grade or year of school you completed?

Never attended school or only attended kindergarten
 Grade 12 or GED (High school graduate)

Grades 1 up to 8 (Elementary to middle school)
 College or technical school 1 year to 3 years

Grades 9 up to 11 (Some high school)
 College 4 years or more (College graduate)

6. Your current employment status? *(Please select all that apply.)*

Employed for wages/salary (full-time/part-time/seasonal)
 Self-employed
 Out of work for more than 1 year
 Out of work for less than 1 year

A Homemaker
 A Student
 Retired
 Unable to work

7. Do you currently have more than one job at this time?

Yes
 No

8. Based on everyone that lives under one roof or house, what is the annual household income from all sources over the past 12 months?

Under \$10,000

From \$10,000 to less than \$20,000

From \$20,000 to less than \$35,000

From \$35,000 to less than \$60,000

From \$60,000 to less than \$75,000

\$75,000 or more

No Response

Food & Activity Log

Name of Child: _____

Name of Parent: _____

For this record period, please record during the days outlined below:

Day (e.g., Monday)	Date (mm/dd/yyyy)

If you have questions, please call _____ at _____

or email at _____.

Please, do not change your child's eating or activity habits. We are interested in finding out what your child does on a normal basis.

Additional Information to Record for Each Time Your Child Eats Something

Next to each meal or snack, record additional information. For example, if your child has a "bottled water" while watching a baseball game, the following would be recorded. The place prepared would be "concession stand." The place eaten would be "ball park". The other activity would be "watching ball game." Other examples are in the table below.

Place Prepared	Place Eaten	Other Activities while eating
Home	Home, specify where within home	Sitting & eating only
Grocery store	Friend's home	At day care
Relative's home	Fast-food restaurant	T-ball practice
School	Camp ground	Watching TV
Day care center	Day care center	Running around
Sit-down restaurant	Relative's home	Sports practice
Market stand	Car	Playing video games
Friend's home	School	Family meal time
Fast-food restaurant	Sit-down restaurant	At school
Beach, camp ground	Park bench	At fiesta (party)
Lunch wagon	Backyard	Sitting on porch
Concession stand	Beach	At barbeque

Tips for recording the foods and beverages that your child eats and activities.

- Use an ink pen or a #2 pencil and write clearly
- Fill in the times for each meal and snack and activity
- Write each food or ingredient or activity on a separate line
- Write down everything your child ate and drank throughout the day and night
- Record all beverages, including water. Record all activities, including sleep
- Record foods and activities as soon as possible, that is during or right after.
- Keep the Food & Activity Log with you at all times
- When your child is at day care, with relatives, or friends, ask their help for recording foods and activities.
- Use the recipe pages to describe homemade recipes.
- Remember to save packages & containers. Clean the packages and containers before putting into the bag. Put any school/child care menus in the bag.
- Record only the amount of food that your child ate.

More Tips for Keeping an Accurate Food & Activity Log

- Record the type of activity your child did, e.g. reading, swimming, running, sleeping, watching television.
- Be as specific as possible.
- Record the start time of an activity and the end time of the activity as shown in the sample.

Include Detail About Foods

- Include the cooking method used to prepare food, e.g. baked, broiled, fried, canned, fresh, frozen.
- Include brand names and the name of fast food restaurants whenever possible.
- Describe the liquid included in canned foods, e.g. tuna in water, sliced peaches in heavy syrup.
- Include added condiments, e.g. ketchup, mayonnaise, mustard.
- Record the amount of fat or oil added in cooking.

Guidelines to Estimating Portion Sizes

It's important to be accurate in determining amounts eaten.

- If possible, use measuring cups and measuring spoons provided to make your child's log more accurate.
- In a restaurant, you can ask the serving sizes of various foods (for example, ounces of meat, cups or ounces of ice cream).
- Use the ruler on the back of this book.
- Use the palm of your hand to estimate amounts.
- Use common shapes, such as a deck of cards, a baseball to describe amounts.

Children eat much smaller amounts and more frequently than adults. Therefore, it is important to write down exactly what was eaten and how much at the time of the eating.

Tips for Keeping an Accurate Food & Activity Log

- Brand:** When possible, indicate the brand of processed foods, such as Meadow Gold cottage cheese, Crisco All-Vegetable Shortening. For frozen dinners, indicate the brand and name of the meal.
 - Extras:** Remember to record the foods or condiments that are extra or added on top like salad dressings, butter/sour cream, sugar or milk on cereal, mayonnaise, syrup.
 - Cuts:** For meats, specify the cut if possible. When using ground beef, list the type and percent lean. For chicken, indicate which piece(s) of chicken such as leg, breast. Specify type of fish.
 - Observe:** Observe what your child does throughout the day and record as activities, including sitting, laying on the floor, running, riding a tricycle.
 - Modifications:** Share if the food was low-fat, low-sugar, low-sodium, calcium-fortified, or different from the regular form of the food.
 - Preparation:** Specify the way food was cooked – such as fried, baked, grilled, boiled. Be sure to list any added fat, sugar, oil, butter, even if added after cooking.
 - Live like always:** Do not change your how your child eats or what you and others prepare for your child to eat.
 - Eating out:** If you eat your food away from home, be sure to list the restaurant name and how food was cooked. Include restaurant name and how food was cooked.
 - Thoroughness:** Think "detail". Tell us whether your child ate white or brown rice, 100% orange juice or orange crush, played an active computer game or sat at computer.
 - Eating portions:** When possible, measure portions using the special measuring cups and measuring teaspoons provided. Or use the ruler on the left side of this page.
- Remember to save packages & containers. Clean the packages and containers before putting into the bag. Put any school/child care menus in bag.**

Food & Activity Log

Name of Child: _____

Name of Parent: _____

For this record period, please record during the days outlined below:

Day (e.g., Monday)	Date (mm/dd/yyyy)

If you have questions, please call _____ at _____

or email at _____.

Modified for FAS Approved by UH IRB 7-17-13

Tips for recording the foods and beverages that your child eats and activities.

- Use an ink pen or a #2 pencil and write clearly
 - Fill in the times for each meal and snack and activity
 - Write each food or ingredient or activity on a separate line
 - Write down everything your child ate and drank throughout the day and night
 - Record all beverages, including water. Record all activities, including sleep
 - Record foods and activities as soon as possible, that is during or right after.
 - Keep the Food & Activity Log with you at all times
 - When your child is at day care, with relatives, or friends, ask their help for recording foods and activities.
 - Remember to save packages & containers. Clean the packages and containers before putting into the bag. Put any school/child care menus in the bag.
 - Record only the amount of food that your child ate.
- Water can come from many sources. Examples include catchment, household tap, neighbor's tap, river, stream, creek, bottled purchased at a store. Be as specific as possible.

Please, do not change your child's eating or activity habits. We are interested in finding out what your child does on a usual basis.

Additional Information to Record Each Time Your Child Eats Something

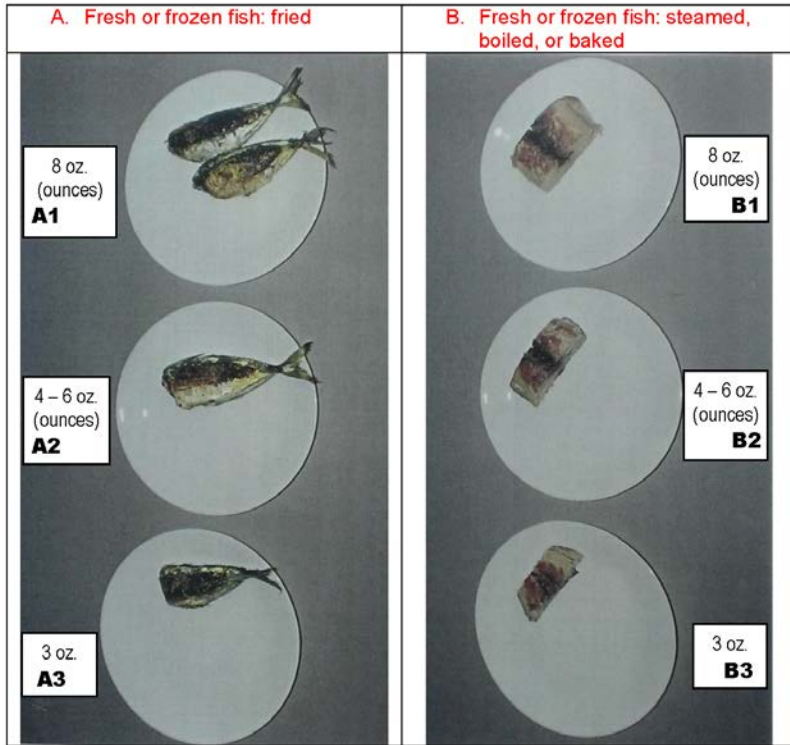

Next to each ingredient or food, record the **source** for the food. That would be whether the food was purchased, caught, gifted, traded, etc. Some examples are provided below.

Purchase	Communal/gift/donation	Local-labor or self-labor
Supermarket	Food bank / food pantry	Fishing
Restaurant	Field trip	Hunting
Road side stand / stall	Church gathering	Home garden
Convenience store	Government assisted	Personal farm
Grocery store	Gift from friend/relative	Community garden
Farmers' market	USDA Commodities	Commercial farm
Lunch wagon / food wagon	Funeral	Ocean gathering
Fish markets	Traditional event	Animal husbandry
Merchant/Cargo		Specify: non-purchase

Next to the first ingredient or food in a single eating event, record additional information about **place prepared, place eaten, and other activities** happening at the same time. For example, if your child has a "bottled water" while watching a baseball game, the following would be recorded. The place prepared would be "concession stand." The place eaten would be "ball park". The other activity would be "watching ball game." Other examples are in the table below.

Place Made	Place Eaten	Other Activities while eating
Home	Home, specify where within home	Sitting & eating only
Grocery store	Friend's home	At day care
Relative's home	Fast-food restaurant	T-ball practice
School	Camp ground	Watching TV
Day care center	Day care center	Running around
Sit-down restaurant	Relative's home	Sports practice
Market stand	Car	Playing video games
Friend's home	School	Family meal time
Fast-food restaurant	Sit-down restaurant	At school
Beach, camp ground	Park bench	At fiesta (party)
Lunch wagon	Backyard	Sitting on porch
Concession stand	Beach	At barbeque

Use the images below to help estimate the amount of fried fish, fresh, or frozen fish, steamed, boiled or baked fish.

Make portions easy, write:
 "Picture A3, Fried fish $\frac{1}{3}$ 3 ounces" OR
 "Picture A2, Fried fish picture, Middle" OR
 "Picture B1, Steamed fish $\frac{1}{3}$ 8 ounces"

Tips for Estimating Serving Size

FOOD/DRINK	RECORD SERVING SIZE AS:
1 oz of Cheese	= 2 slices pre-sliced, wrapped cheese = the size (and thickness) of two (2) dominoes
3 ounces of meat	= One-half of a whole chicken breast = A piece of meat, poultry, or fish the size (and thickness) of a deck of cards = A small hamburger patty (approximately one-quarter pound uncooked) which forms a patty fitting into the palm of your hand
Beverages	soft drinks (12 ounces) = 1 can glass of milk (medium) 8 ounces = 1 cup
Vegetables	1 cup leafy vegetables (such as lettuce, spinach), uncooked = size of a baseball 1 cup peas or chopped veggies, cooked = size of one half baseball 1 medium potato = size of a computer mouse
Fruits	1 medium-size fruit = size of a tennis ball 1 cup chopped fruit = size of one half baseball 3/4 cup fruit or vegetable juice = size of a tennis ball
Peanut butter, beans, nuts	1 teaspoon of butter or margarine = size of a postage stamp 2 tablespoons peanut butter = size of a ping-pong ball 1 cup cooked beans = size of a baseball 1/2 cup chopped nuts = size of one half baseball
How many peanuts or potato chips in one ounce?	Approximately one handful
Cereal	3/4 cup cold cereal = size of a tennis ball

More Tips for Keeping an Accurate Food & Activity Log

- Record the type of activity your child did, e.g. reading, swimming slow, running fast, sleeping, watching television.
- Be as specific as possible.
- Record the start time of an activity and the end time of the activity as shown in the sample.

Include Detail About Foods

- Include the cooking method used to prepare food, e.g. baked, broiled, fried, canned, fresh, frozen.
- Include brand names and the name of fast food restaurants whenever possible.
- Describe the liquid included in canned foods, e.g. tuna in water, sliced peaches in heavy syrup.
- Include added condiments, e.g. ketchup, mayonnaise, mustard.
- Record the amount of fat or oil added in cooking.

Guidelines to Estimating Portion Sizes

It's important to be accurate in determining amounts eaten.

- If possible, use measuring cups and measuring spoons provided to make your child's log more accurate.
- In a restaurant, you can ask the serving sizes of various foods (for example, ounces of meat, cups or ounces of ice cream).
- Use the ruler on the back of this book.
- Use the palm of your hand to estimate amounts.
- Use the entire hand to describe the size of reef fish, e.g., size of entire hand, $\frac{3}{4}$ of an entire hand.
- Use common shapes, such as a deck of cards, a baseball to describe amounts.

Children eat much smaller amounts and more frequently than adults. Therefore, it is important to write down exactly what was eaten and how much at the time of the eating.

Tips for Keeping an Accurate Food & Activity Log

- Brand:** When possible, indicate the brand of processed foods, such as Meadow Gold cottage cheese, Crisco All-Vegetable Shortening. For frozen dinners, indicate the brand and name of the meal.
- Extras:** Remember to record the foods or condiments that are extra or added on top like salad dressings, butter/sour cream, sugar or milk on cereal, mayonnaise, syrup.
- Cuts:** For meats, specify the cut if possible. When using ground beef, list the type and percent lean. For chicken, indicate which piece(s) of chicken such as leg, breast. Specify type of fish.
- Observe:** Observe what your child does throughout the day and record as activities, including sitting, laying on the floor, running, riding a tricycle.
- Modifications:** Share if the food was low-fat, low-sugar, low-sodium, calcium-fortified, or different from the regular form of the food.
- Preparation:** Specify the way food was cooked – such as fried, baked, grilled, boiled. Be sure to list any added fat, sugar, oil, butter, even if added after cooking.
- Live like always:** Do not change your how your child eats or what you and others prepare for your child to eat.
- Eating out:** If you eat your food away from home, be sure to list the restaurant name and how food was cooked. Include restaurant name and how food was cooked.
- Thoroughness:** Think "detail". Tell us whether your child ate white or brown rice, 100% orange juice or orange crush, played an active computer game or sat at computer.
- Eating portions:** When possible, measure portions using the special measuring cups and measuring teaspoons provided. Or use the ruler on the left side of this page.
Remember to save packages & containers. Clean the packages and containers before putting into the bag. Put any school/child care menus in bag.

FORM 23-04	Children's Healthy Living Program Lifestyle Behavior 	For Office Use Only Child's ID: _____ Date: ____/____/20____ MM DD YEAR Checked by: _____
------------	--	--

Please complete the following questions about your child.

Monday to Friday

1. On usual weekdays (Monday to Friday), how long on average a day does your child spend watching television and/or videos/DVD? (Please choose one, ☐; h= hours)

0h 0.5h 1h 1.5h 2h 2.5h 3h 3.5h 4h 4.5h 5h 5.5h 6h 6.5h 7h+

2. On usual weekdays (Monday to Friday), how long on average a day does your child spend playing **INACTIVE** video games (DS, Play station, XBOX, Wii, computer games, etc.)? (Please choose one, ☐; h= hours)

0h 0.5h 1h 1.5h 2h 2.5h 3h 3.5h 4h 4.5h 5h 5.5h 6h 6.5h 7h+

3. On usual weekdays (Monday to Friday), how long on average a day does your child spend playing **ACTIVE** video games (DS, Play station, XBOX, Wii, computer games, etc.) that incorporate movement or exercise? (Please choose one, ☐; h= hours)

0h 0.5h 1h 1.5h 2h 2.5h 3h 3.5h 4h 4.5h 5h 5.5h 6h 6.5h 7h+

Saturday to Sunday

4. On a usual weekend day (Saturday to Sunday), how long on average a day does your child spend watching television and/or videos/DVD? (Please choose one, ☐; h= hours)

0h 0.5h 1h 1.5h 2h 2.5h 3h 3.5h 4h 4.5h 5h 5.5h 6h 6.5h 7h+

5. On a usual weekend day (Saturday to Sunday), how long on average a day does your child spend playing **INACTIVE** video games (DS, Play station, XBOX, Wii, computer games, etc.)? (Please choose one, ☐; h= hours)

0h 0.5h 1h 1.5h 2h 2.5h 3h 3.5h 4h 4.5h 5h 5.5h 6h 6.5h 7h+

6. On a usual weekend day (Saturday to Sunday), how long on average a day does your child spend playing **ACTIVE** video games (DS, Play station, XBOX, Wii, computer games, etc.) that incorporate movement or exercise? (Please choose one, ☐; h= hours)

0h 0.5h 1h 1.5h 2h 2.5h 3h 3.5h 4h 4.5h 5h 5.5h 6h 6.5h 7h+

FORM 23-05	Children's Healthy Living Program Sleep Behavior 	For Office Use Only Child's ID: _____ Date: ____/____/20____ <small>MM DD YEAR</small> Checked by: _____
------------	---	---

Please complete the questions below in regard to your child's sleep behavior.

1. How long after going to bed does your child usually fall asleep?	
<input type="checkbox"/>	0 to less than 15 minutes
<input type="checkbox"/>	15 to less than 30 minutes
<input type="checkbox"/>	30 to less than 45 minutes
<input type="checkbox"/>	45 to less than 60 minutes
<input type="checkbox"/>	More than 60 minutes
2. Your child goes to bed reluctantly, (hesitant, slowly, involuntary)...	
<input type="checkbox"/>	The sleep behavior never occurs
<input type="checkbox"/>	The behavior occurs once or twice a month
<input type="checkbox"/>	Occurs one or two times a week
<input type="checkbox"/>	Occurs between three and five nights a week
<input type="checkbox"/>	The sleep behavior happens every night
3. The child has difficulty getting to sleep at night (and may require a parent to be present)	
<input type="checkbox"/>	The sleep behavior never occurs
<input type="checkbox"/>	The behavior occurs once or twice a month
<input type="checkbox"/>	Occurs one or two times a week
<input type="checkbox"/>	Occurs between three and five nights a week
<input type="checkbox"/>	The sleep behavior happens every night
4. The child does not fall asleep in his or her own bed	
<input type="checkbox"/>	The sleep behavior never occurs
<input type="checkbox"/>	The behavior occurs once or twice a month
<input type="checkbox"/>	Occurs one or two times a week
<input type="checkbox"/>	Occurs between three and five nights a week
<input type="checkbox"/>	The sleep behavior happens every night

FORM 23-05	Children's Healthy Living Program Sleep Behavior		For Office Use Only
			Child's ID: _____ Date: ____/____/20____ <small>MM DD YEAR</small> Checked by: _____

5.	The child wakes up two or more times in the night
<input type="checkbox"/>	The sleep behavior never occurs
<input type="checkbox"/>	The behavior occurs once or twice a month
<input type="checkbox"/>	Occurs one or two times a week
<input type="checkbox"/>	Occurs between three and five nights a week
<input type="checkbox"/>	The sleep behavior happens every night
6.	After waking up in the night the child has difficulty falling asleep again by himself or herself
<input type="checkbox"/>	The sleep behavior never occurs
<input type="checkbox"/>	The behavior occurs once or twice a month
<input type="checkbox"/>	Occurs one or two times a week
<input type="checkbox"/>	Occurs between three and five nights a week
<input type="checkbox"/>	The sleep behavior happens every night
7.	The child sleeps in the parent's bed at some time during the night
<input type="checkbox"/>	The sleep behavior never occurs
<input type="checkbox"/>	The behavior occurs once or twice a month
<input type="checkbox"/>	Occurs one or two times a week
<input type="checkbox"/>	Occurs between three and five nights a week
<input type="checkbox"/>	The sleep behavior happens every night
8.	If the child wakes, he or she uses a comforter (e.g. pacifier or binky) and requires a parent to replace it
<input type="checkbox"/>	The sleep behavior never occurs
<input type="checkbox"/>	The behavior occurs once or twice a month
<input type="checkbox"/>	Occurs one or two times a week
<input type="checkbox"/>	Occurs between three and five nights a week
<input type="checkbox"/>	The sleep behavior happens every night

FORM 23-05	Children's Healthy Living Program Sleep Behavior 	For Office Use Only Child's ID: _____ Date: ____/____/20____ <small>MM DD YEAR</small> Checked by: _____
------------	---	---

9. The child wants a drink during the night (including breast or bottle-feed)	
<input type="checkbox"/>	The sleep behavior never occurs
<input type="checkbox"/>	The behavior occurs once or twice a month
<input type="checkbox"/>	Occurs one or two times a week
<input type="checkbox"/>	Occurs between three and five nights a week
<input type="checkbox"/>	The sleep behavior happens every night
10. Do you think your child has sleeping difficulties?	
<input type="checkbox"/> Yes	<input type="checkbox"/> No
Please explain:	

Questions above were modified from the Tayside Children's Sleep Questionnaire (McGreavy et al. *Child: Care, Health & Development* 31(5); 539-544, 2005).

FORM 59-02	Children's Healthy Living Program Acanthosis Nigricans Screen 	For Office Use Only	
		Child's ID: _____	_____
		Date: _____ / _____ /20____	_____
		Measured by: _____	_____
		Checked by: _____	_____

Instructions: Rate and circle using a black/blue pen the severity of acanthosis nigricans on the back of the neck using the screening scale below.

Neck Severity Rating:	0	1	2	3	4
Comments:	_____				

Acanthosis Nigricans Screening Scale

(Burke JP, Hale DE, Hazuda HP, Stern MP. 1999. A quantitative scale of acanthosis nigricans. Diabetes Care 22:1655-1659.)

Neck Severity Rating	Neck Severity	Description
0	Absent	Not detectable on close inspection.
1	Present	Clearly present on close visual inspection, not visible to the casual observer, extent not measurable
2	Mild	Limited to the base of the skull, does not extend to the lateral margins of the neck (usually <3 inches in breadth).
3	Moderate	Extending to the lateral margins of the neck (posterior border of the sternocleidomastoid) (usually 3-6 inches), should not be visible when the participant is viewed from the front.
4	Severe	Extending anteriorly (>6 inches), visible when the participant is viewed from the front.

Approved by UH IRB 10-19-2012
